

**2.35** Water flows upward in a pipe slanted at  $30^\circ$ , as in Fig. P2.35. The mercury manometer reads  $h = 12$  cm. What is the pressure difference between points (1) and (2) in the pipe?

Fig. P2.35

**Solution:** The vertical distance between points 1 and 2 equals  $(2.0 \text{ m})\tan 30^\circ$  or 1.155 m. Go around the U-tube hydrostatically from point 1 to point 2:

$$p_1 + 9790h - 133100h - 9790(1.155 \text{ m}) = p_2,$$

$$\text{or: } p_1 - p_2 = (133100 - 9790)(0.12) + 11300 = \mathbf{26100 \text{ Pa}} \quad \text{Ans.}$$

**2.36** In Fig. P2.36 both the tank and the slanted tube are open to the atmosphere. If  $L = 2.13$  m, what is the angle of tilt  $\phi$  of the tube?

Fig. P2.36

**Solution:** Proceed hydrostatically from the oil surface to the slanted tube surface:

$$p_a + 0.8(9790)(0.5) + 9790(0.5) - 9790(2.13 \sin \phi) = p_a,$$

$$\text{or: } \sin \phi = \frac{8811}{20853} = 0.4225, \quad \text{solve } \phi \approx \mathbf{25^\circ} \quad \text{Ans.}$$

**2.37** The inclined manometer in Fig. P2.37 contains Meriam red oil,  $SG = 0.827$ . Assume the reservoir is very large. If the inclined arm has graduations 1 inch apart, what should  $\theta$  be if each graduation represents 1 psf of the pressure  $p_A$ ?

Fig. P2.37
