

ENSC 283 Week # 8, Tutorial # 5 – First Law Analysis

Problem 1: A tank of 0.1 m^3 volume is connected to a high-pressure air line; both line and tank are initially at a uniform temperature of 20°C . The initial tank gage pressure is 100 kPa . The absolute line pressure is 2.0 MPa ; the line is large enough so that its temperature and pressure may be assumed constant. The tank temperature is monitored by a fast-response thermocouple. At the instant after the valve is opened, the tank temperature rises at the rate of $0.05^\circ\text{C}/\text{s}$. Determine the instantaneous flow rate of air into the tank if heat transfer is neglected.

Solution

Step 1: Write out what you are required to solve for (this is so you don't forget to answer everything the question is asking for)

Find:

- \dot{m} , the instantaneous flow rate of air into the tank

Step 2: Prepare a data table

Data	Value	Unit
v_{tank}	0.1	m^3
p_{tank} (gage)	100	kPa
T	20	$^\circ\text{C}$
\dot{m}	0.05	$^\circ\text{C}/\text{s}$

Step 3: State your assumptions (you may have to add to your list of assumptions as you proceed in the problem)

Assumptions:

- 1) $\dot{Q} = 0$
- 2) $\dot{W}_s = 0$
- 3) $\dot{W}_v = 0$
- 4) $\dot{W}_{other} = 0$
- 5) Velocities in line and tank are small
- 6) Neglect potential energy
- 7) Properties uniform in tank
- 8) Ideal gas, $p = \rho RT, d\hat{u} = c_v dT$

Step 4: Calculations

The control volume is shown in the figure. Applying the energy equation to the CV, we get:

$$\dot{Q} - \dot{W}_s - \dot{W}_v - \dot{W}_{other} = \frac{\partial}{\partial t} \left(\int_{CV} e \rho d\vartheta \right) + \int_{CS} (e + pv) \rho (\mathbf{V} \cdot \mathbf{n}) dA \quad (\text{Eq1})$$

The left hand side of the above equation is zero, see the assumptions. The total energy can be written as:

$$e = \hat{u} + \frac{V^2}{2} + gz = \hat{u} \quad (\text{Eq2})$$

Applying the assumptions and substituting Eq2 into Eq1, we obtain:

$$\frac{\partial}{\partial t} \left(\int_{CV} \hat{u}_{tank} \rho d\vartheta \right) + (\hat{u} + pv)_{line} (-\rho VA) = 0 \quad (\text{Eq3})$$

This expresses the fact the gain in energy of the tank is due to influx of fluid energy (in the form of enthalpy $h = \hat{u} + pv$) from the line. We are interested in the initial instant, when T is uniform at 20°C , so $\hat{u}_{tank} = \hat{u}_{line} = \hat{u}$, the internal energy at T ; also, $pv_{line} = RT$, and

$$\frac{\partial}{\partial t} \left(\int_{CV} \hat{u} \rho d\vartheta \right) + (\hat{u} + RT)(-\rho VA) = 0 \quad (\text{Eq4})$$

Since tank properties are uniform, $\partial/\partial t$ may be replaced by d/dt , and

$$\frac{d}{dt} (\hat{u}M) = (\hat{u} + RT)\dot{m} \quad (\text{Eq5})$$

where M is the instantaneous mass in the tank and $\dot{m} = \rho VA$ is the mass flow rate. This equation can be written as:

$$\hat{u} \frac{dM}{dt} + M \frac{d\hat{u}}{dt} = \hat{u}\dot{m} + RT\dot{m} \quad (\text{Eq6})$$

The term dM/dt may be evaluated from continuity:

$$\frac{\partial}{\partial t} \left(\int_{CV} \rho d\vartheta \right) + \int_{CS} \rho (\mathbf{V} \cdot \mathbf{n}) dA = 0 \quad (\text{Eq7})$$

$$\frac{dM}{dt} + (-\rho VA) = 0 \text{ or } \frac{dM}{dt} = \dot{m} \quad (\text{Eq8})$$

Substituting in Eq6 gives

$$\hat{u}\dot{m} + M c_v \frac{dT}{dt} = \hat{u}\dot{m} + RT\dot{m} \quad (\text{Eq9})$$

or

$$\dot{m} = \frac{M c_v \frac{dT}{dt}}{RT} = \frac{\rho_{\text{tank}} \vartheta_{\text{tank}} c_v \frac{dT}{dt}}{RT} \quad (\text{Eq10})$$

At $t = 0$, $p_{\text{tank}} = 100 \text{ kPa (gage)}$, and

$$\begin{aligned} \rho_{\text{tank}} &= \frac{p_{\text{tank}}}{RT} = (1 + 1.0135) 10^5 \frac{\text{N}}{\text{m}^2} \times \frac{\text{kg} \cdot \text{K}}{287 \text{ N} \cdot \text{m}} \times \frac{1}{293.15 \text{ K}} \\ &= 2.393 \text{ kg/m}^3 \end{aligned} \quad (\text{Eq11})$$

Substituting into Eq10, we obtain

$$\begin{aligned} \dot{m} = & \left(2.393 \frac{kg}{m^3}\right) (0.1 m^3) \left(717 \frac{N.m}{kg.K}\right) \left(0.05 \frac{K}{s}\right) \left(\frac{kg.K}{287 N.m}\right) \\ & \times \left(\frac{1}{293.15 K}\right) \left(\frac{1000 g}{kg}\right) = \mathbf{0.102 g/s} \end{aligned} \quad (\text{Eq12})$$
