

A Uniform Gravitational Field

- We could define a gravitational field in much the same way we have defined the electric field:

$$\vec{E} = \frac{\vec{F}_{on\ q}}{q}, \vec{g} = \frac{\vec{F}_{on\ m}}{m}$$

(note that $m/s^2 = N/kg$)

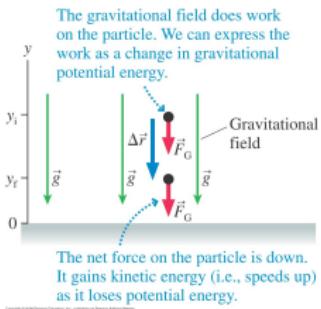

A Uniform Gravitational Field

- We could define a gravitational field in much the same way we have defined the electric field:

$$\vec{E} = \frac{\vec{F}_{\text{on } q}}{q}, \vec{g} = \frac{\vec{F}_{\text{on } m}}{m}$$

(note that $\text{m/s}^2 = \text{N/kg}$)

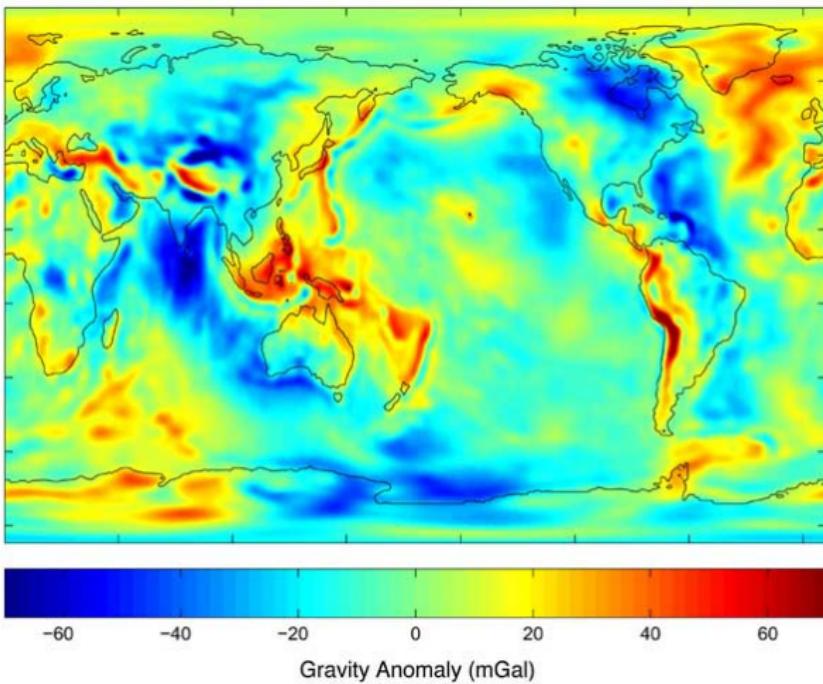

- The gravitational field near the earth is nearly uniform ($\approx 9.8 \text{ N/kg}$) much like the electric field in a capacitor.

A Uniform Gravitational Field

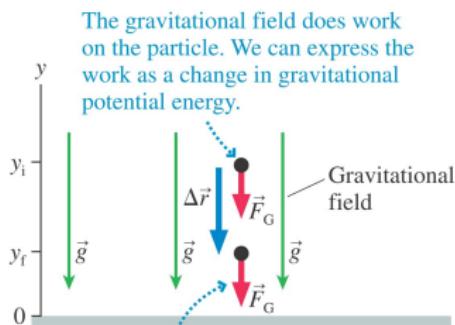

Small variations in \vec{g} on the earth's surface are of interest.

<http://www.physlink.com/news/072403GraceGravityField.cfm>

A Uniform Gravitational Field

- The work done by gravity on a falling particle is

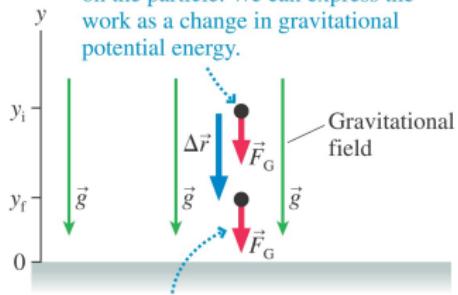

$$W_{grav} = F_G \Delta r \cos 0^\circ = mgy_i - mgy_f$$

The net force on the particle is down. It gains kinetic energy (i.e., speeds up) as it loses potential energy.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison Wesley.

A Uniform Gravitational Field

The gravitational field does work on the particle. We can express the work as a change in gravitational potential energy.

The net force on the particle is down. It gains kinetic energy (i.e., speeds up) as it loses potential energy.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison Wesley.

- The work done by gravity on a falling particle is

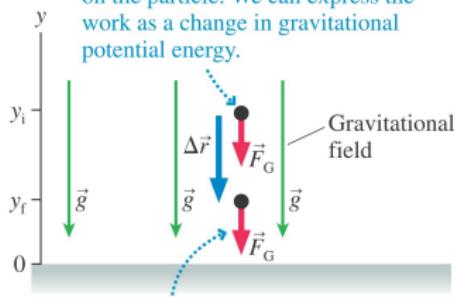

$$W_{grav} = F_G \Delta r \cos 0^\circ = mgy_i - mgy_f$$

- We can turn this into potential energy by

$$\Delta U_{grav} = -W_{grav} = mgy_f - mgy_i$$

A Uniform Gravitational Field

The gravitational field does work on the particle. We can express the work as a change in gravitational potential energy.

The net force on the particle is down. It gains kinetic energy (i.e., speeds up) as it loses potential energy.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison Wesley.

- The work done by gravity on a falling particle is

$$W_{grav} = F_G \Delta r \cos 0^\circ = mgy_i - mgy_f$$

- We can turn this into potential energy by

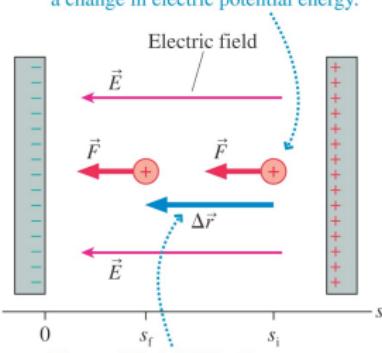

$$\Delta U_{grav} = -W_{grav} = mgy_f - mgy_i$$

- If we define U_0 as the potential energy at $y = 0$ we get

$$U_{grav} = U_0 + mgy$$

A Uniform Electric Field

The electric field does work on the particle. We can express the work as a change in electric potential energy.

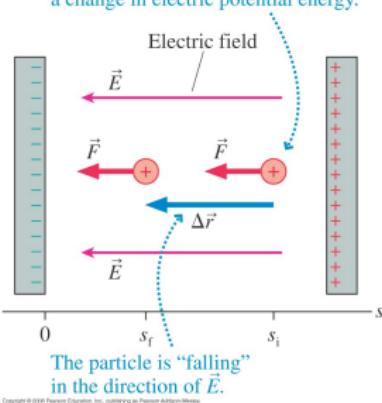

The particle is “falling” in the direction of \vec{E} .

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

- The gravitational field near the earth always points towards the earth, in a capacitor the electric field always points towards the negative plate.

A Uniform Electric Field

The electric field does work on the particle. We can express the work as a change in electric potential energy.

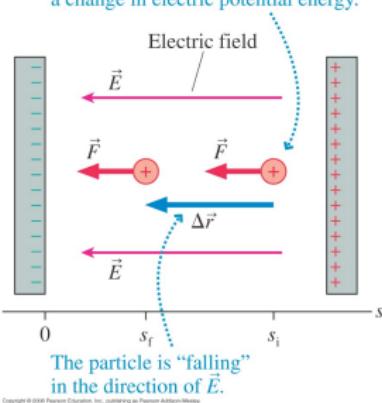

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley

- The gravitational field near the earth always points towards the earth, in a capacitor the electric field always points towards the negative plate.
- Instead of y , define s towards the positive plate from $s = 0$ at the negative plate. A positive particle “falls” towards $s = 0$.

A Uniform Electric Field

The electric field does work on the particle. We can express the work as a change in electric potential energy.

- The gravitational field near the earth always points towards the earth, in a capacitor the electric field always points towards the negative plate.
- Instead of y , define s towards the positive plate from $s = 0$ at the negative plate. A positive particle “falls” towards $s = 0$.
- The work is

$$W_{elec} = F_e \Delta r \cos 0^\circ = qE s_i - qE s_f$$

- We can turn this into potential energy by

$$\Delta U_{elec} = -W_{elec} = qE s_f - qE s_i$$

A Uniform Electric Field

The electric field does work on the particle. We can express the work as a change in electric potential energy.

- The gravitational field near the earth always points towards the earth, in a capacitor the electric field always points towards the negative plate.
- Instead of y , define s towards the positive plate from $s = 0$ at the negative plate. A positive particle "falls" towards $s = 0$.
- The work is

$$W_{elec} = F_e \Delta r \cos 0^\circ = qE s_i - qE s_f$$

- We can turn this into potential energy by

$$\Delta U_{elec} = -W_{elec} = qE s_f - qE s_i$$

- Again we can write:

$$U_{elec} = U_0 + qE s$$

The Potential Energy of Point Charges (29.2)

- We now come back to the force between two point charges. Again, we will use Coulomb's law. This time we are seeking potential energy for a system of two charges.

The Potential Energy of Point Charges (29.2)

- We now come back to the force between two point charges. Again, we will use Coulomb's law. This time we are seeking potential energy for a system of two charges.
- As two like charges repel each other the force between them decreases. So, we need the integral form of our work equation

$$W_{elec} = \int_{x_i}^{x_f} F_{1 \text{ on } 2} dx = \int_{x_i}^{x_f} \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x^2} dx = -\frac{q_1 q_2}{4\pi\epsilon_0} \left(\frac{1}{x_f} - \frac{1}{x_i} \right)$$

The Potential Energy of Point Charges (29.2)

- We now come back to the force between two point charges. Again, we will use Coulomb's law. This time we are seeking potential energy for a system of two charges.
- As two like charges repel each other the force between them decreases. So, we need the integral form of our work equation

$$W_{elec} = \int_{x_i}^{x_f} F_{1 \text{ on } 2} dx = \int_{x_i}^{x_f} \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x^2} dx = -\frac{q_1 q_2}{4\pi\epsilon_0} \left(\frac{1}{x_f} - \frac{1}{x_i} \right)$$

- The change in potential energy is $-W_{elec}$ and, if we set $U_0 = 0$ then

$$U_{elec} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x}$$

The Potential Energy of Point Charges (29.2)

- We now come back to the force between two point charges. Again, we will use Coulomb's law. This time we are seeking potential energy for a system of two charges.
- As two like charges repel each other the force between them decreases. So, we need the integral form of our work equation

$$W_{elec} = \int_{x_i}^{x_f} F_{1 \text{ on } 2} dx = \int_{x_i}^{x_f} \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x^2} dx = -\frac{q_1 q_2}{4\pi\epsilon_0} \left(\frac{1}{x_f} - \frac{1}{x_i} \right)$$

- The change in potential energy is $-W_{elec}$ and, if we set $U_0 = 0$ then

$$U_{elec} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x}$$

- This also works for two opposite charges and for charged spheres.

The Potential Energy of Point Charges (29.2)

- We now come back to the force between two point charges. Again, we will use Coulomb's law. This time we are seeking potential energy for a system of two charges.
- As two like charges repel each other the force between them decreases. So, we need the integral form of our work equation

$$W_{elec} = \int_{x_i}^{x_f} F_{1 \text{ on } 2} dx = \int_{x_i}^{x_f} \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x^2} dx = -\frac{q_1 q_2}{4\pi\epsilon_0} \left(\frac{1}{x_f} - \frac{1}{x_i} \right)$$

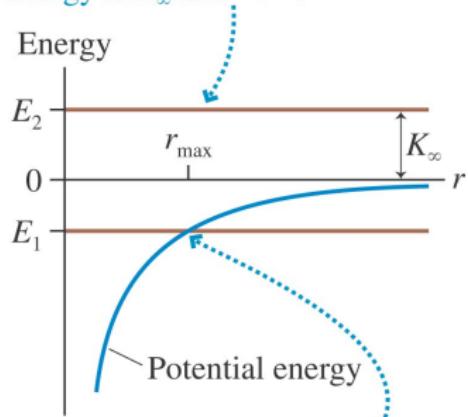

- The change in potential energy is $-W_{elec}$ and, if we set $U_0 = 0$ then

$$U_{elec} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{x}$$

- This also works for two opposite charges and for charged spheres.
- For multiple charges just add the potentials of every pair.

The Zero of Potential Energy

Two particles with total energy $E_2 > 0$ can move apart forever. Their kinetic energy is K_∞ as $r \rightarrow \infty$.

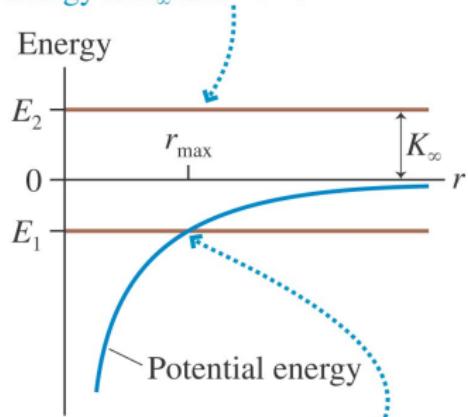

Two particles with total energy $E_1 < 0$ are a bound system. They can't get farther apart than r_{\max} .

- The zero of gravitational potential energy is the center of the earth...or the surface if you cannot make it to the center.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

- If we define U_0 as the value at infinity then our U_{elec} is just the “amount of interaction” (ie. it is relative to zero).
- The tricky bit is that now we have negative potential energies.

The Electric Potential (29.4)

The potential at this point is V .

The source charges alter the space around them by creating an electric potential.

Source charges

- We introduced the concept of electric field to solve our “action at a distance” problem. A charge alters the space around it and other charges interact with the field.

If charge q is in the potential, the electric potential energy is $U_{q+\text{sources}} = qV$.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$V \equiv \frac{U_{q+\text{sources}}}{q}$$

- Like for \vec{E} , the value of V is independent of the test charge q . The source charge makes the potential regardless of other charges.
- The unit of electric potential is J/C or **Volts** (V).

What Good is Electric Potential?

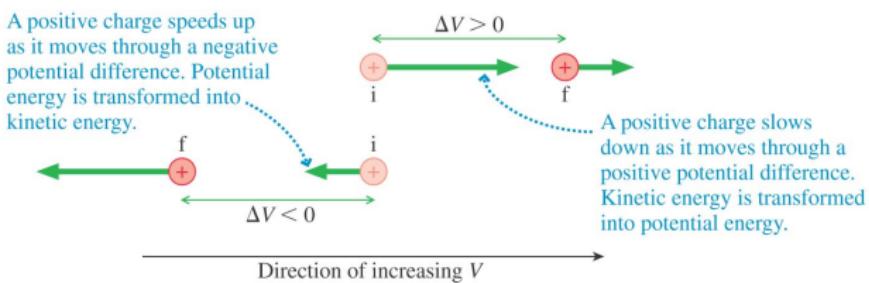

- Electric potential depends only on source charges and their geometry.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

What Good is Electric Potential?

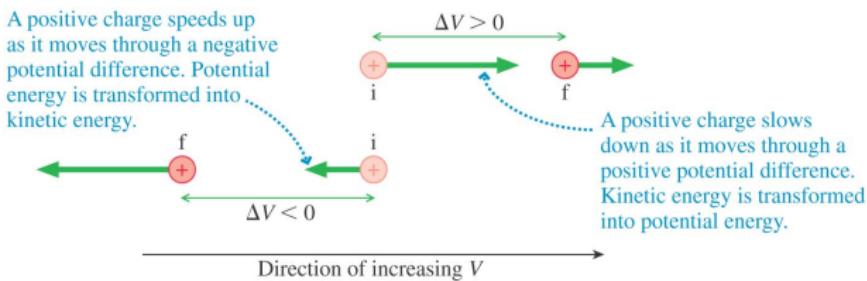

- Electric potential depends only on source charges and their geometry.
- If we know the electric potential in a region of space we know the interaction energy of any charged particle in that region ($U = qV$).

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

What Good is Electric Potential?

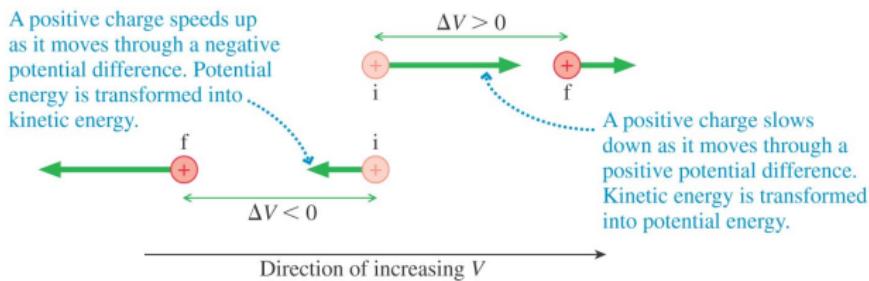

- Electric potential depends only on source charges and their geometry.
- If we know the electric potential in a region of space we know the interaction energy of any charged particle in that region ($U = qV$).
- So, it can be highly useful to calculate the potential.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

What Good is Electric Potential?

- Electric potential depends only on source charges and their geometry.
- If we know the electric potential in a region of space we know the interaction energy of any charged particle in that region ($U = qV$).
- So, it can be highly useful to calculate the potential.
- If a charged particle moves through a **potential difference** ($\Delta V = V_f - V_i$) it will accelerate.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

What Good is Electric Potential?

- If a particle moves through potential difference ΔV the potential energy changes like

$$\Delta U = q\Delta V$$

What Good is Electric Potential?

- If a particle moves through potential difference ΔV the potential energy changes like

$$\Delta U = q\Delta V$$

- Conservation of energy gives

$$\Delta K + q\Delta V = 0$$

What Good is Electric Potential?

- If a particle moves through potential difference ΔV the potential energy changes like

$$\Delta U = q\Delta V$$

- Conservation of energy gives

$$\Delta K + q\Delta V = 0$$

What Good is Electric Potential?

- If a particle moves through potential difference ΔV the potential energy changes like

$$\Delta U = q\Delta V$$

- Conservation of energy gives

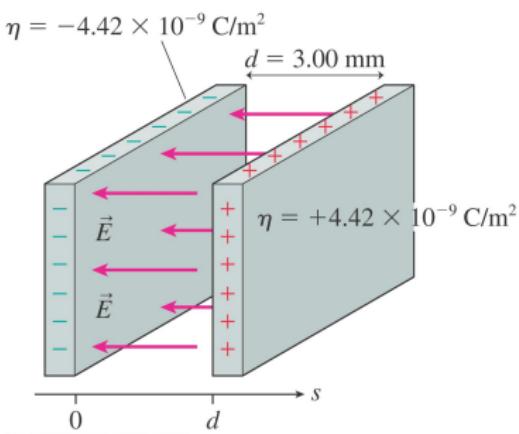

$$\Delta K + q\Delta V = 0$$

$$K_f + qV_f = K_i + qV_i$$

- Conservation of energy will be a useful tool in the problems we solve in the coming weeks.

The Electric Potential Inside a Parallel Plate Capacitor (29.5)

- Electric field inside this capacitor:

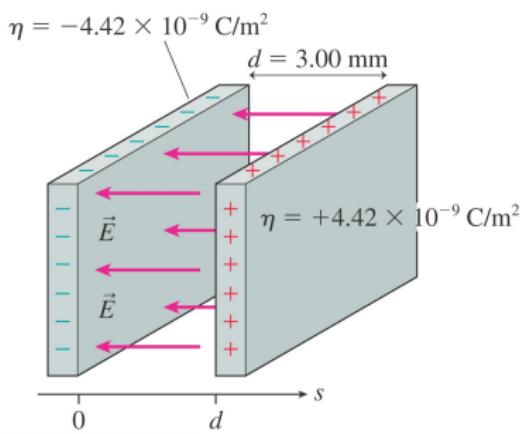

$$|E| = \frac{\eta}{\epsilon_0} = 500 \text{ N/C}$$

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The Electric Potential Inside a Parallel Plate Capacitor (29.5)

- Electric field inside this capacitor:

$$|E| = \frac{\eta}{\epsilon_0} = 500 \text{ N/C}$$

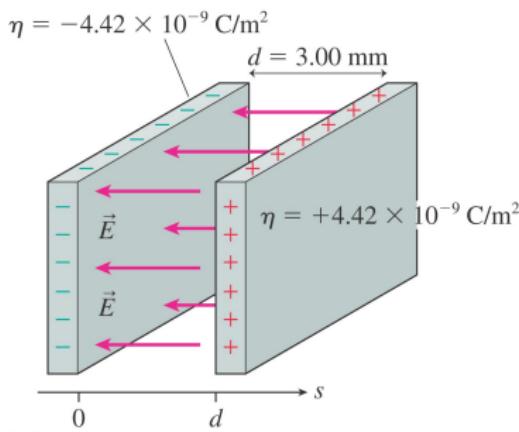

- We already know that the electric potential energy is

$$U_{elec} = qEs$$

where s is the distance from the negative electrode.

The Electric Potential Inside a Parallel Plate Capacitor (29.5)

- Electric field inside this capacitor:

$$|E| = \frac{\eta}{\epsilon_0} = 500 \text{ N/C}$$

- We already know that the electric potential energy is

$$U_{\text{elec}} = qEs$$

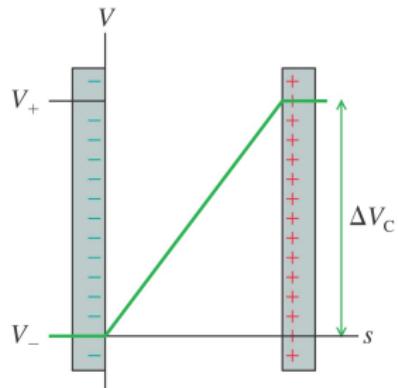

where s is the distance from the negative electrode.

- The potential is then

$$V = \frac{U_{\text{elec}}}{q} = Es$$

The Electric Potential Inside a Parallel Plate Capacitor

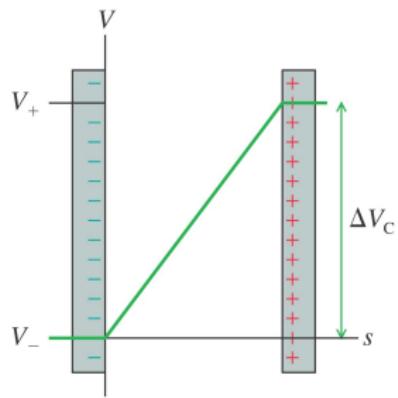

- Electric potential increases linearly from the negative plate towards the positive.

Copyright 2004 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The Electric Potential Inside a Parallel Plate Capacitor

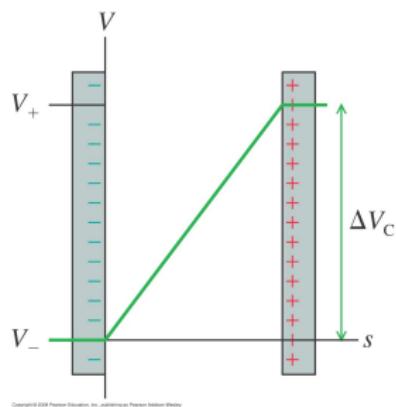

- Electric potential increases linearly from the negative plate towards the positive.
- If we define the negative plate as $V_- = 0$, then $V_+ = Ed$ and the potential difference is

$$\Delta V_C = V_+ - V_- = Ed$$

The Electric Potential Inside a Parallel Plate Capacitor

- Electric potential increases linearly from the negative plate towards the positive.
- If we define the negative plate as $V_- = 0$, then $V_+ = Ed$ and the potential difference is

$$\Delta V_C = V_+ - V_- = Ed$$

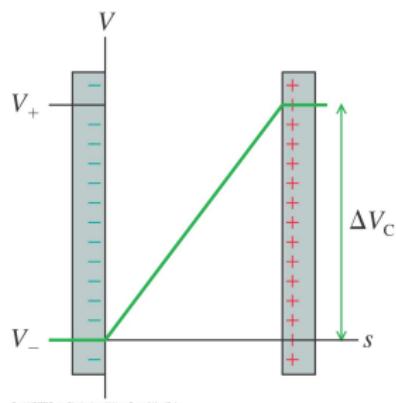

- In this example we have

$$\Delta V_C = (500 \text{ N/C})(0.0030 \text{ m}) = 1.5 \text{ V}$$

This is the voltage across the capacitor.

The Electric Potential Inside a Parallel Plate Capacitor

- Electric potential increases linearly from the negative plate towards the positive.
- If we define the negative plate as $V_- = 0$, then $V_+ = Ed$ and the potential difference is

$$\Delta V_C = V_+ - V_- = Ed$$

- In this example we have

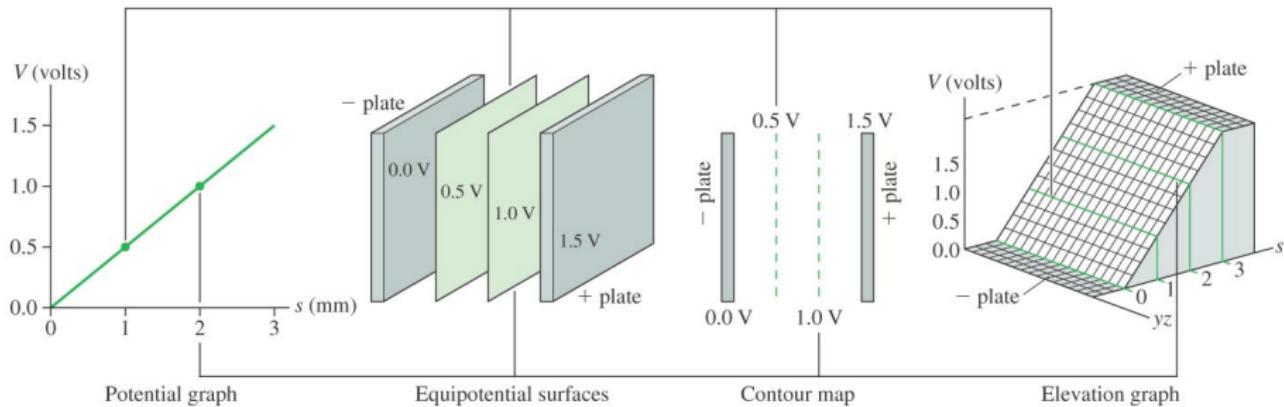

$$\Delta V_C = (500 \text{ N/C})(0.0030 \text{ m}) = 1.5 \text{ V}$$

This is the voltage across the capacitor.

- It is useful to express the field in terms of the potential

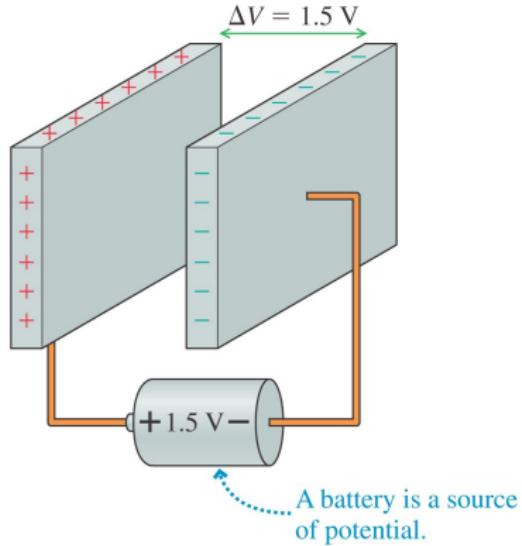

$$E = \frac{\Delta V_C}{d}$$
