

Cyclotron Motion

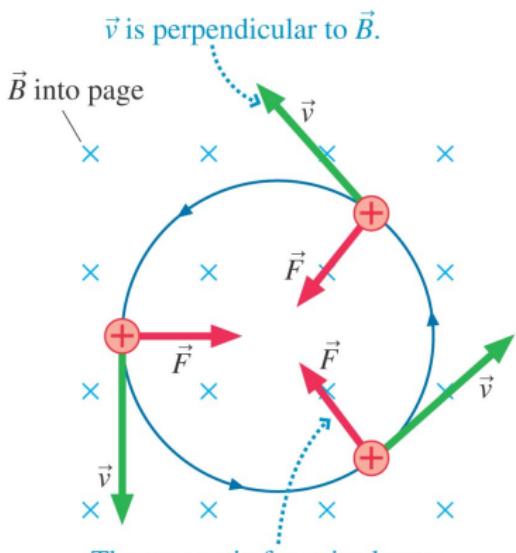

\vec{v} is perpendicular to \vec{B} .

- We can also work-out the frequency of the cyclotron motion

$$f_{cyc} = \frac{qB}{2\pi m}$$

Cyclotron Motion

\vec{v} is perpendicular to \vec{B} .

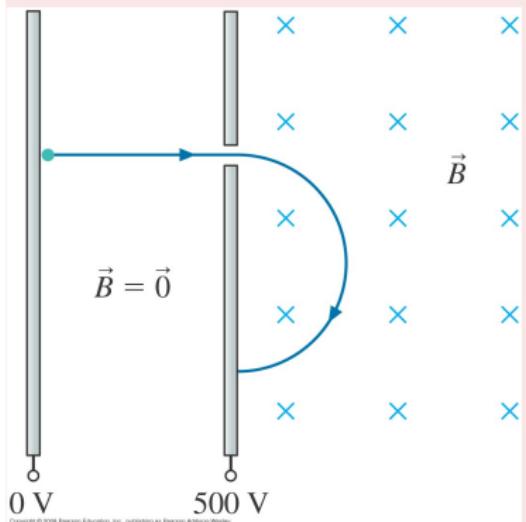

- We can also work-out the frequency of the cyclotron motion

$$f_{cyc} = \frac{qB}{2\pi m}$$

- q/m is the particle's charge-to-mass ratio. Notice that the frequency does not depend on the particle's velocity!!

Example 33.11

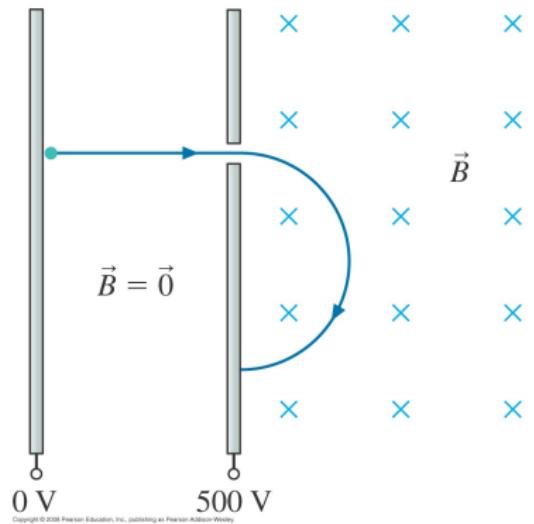

Example 33.11

An electron is accelerated from rest through a potential difference of 500 V, then injected into a uniform magnetic field. Once in the magnetic field it completes half a revolution in 2.0 ns. What is the radius of the orbit?

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Example 33.11

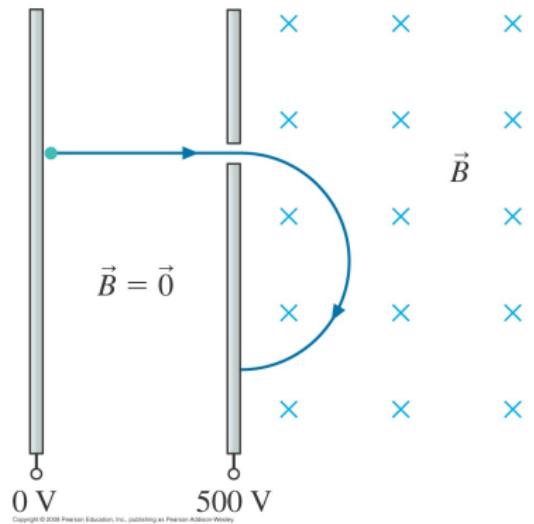

- We can do the electric field part using conservation of energy:

$$K_f + qV_f = K_i + qV_i$$

Copyright 02008 Pearson Education, Inc., publishing as Pearson Addison Wesley

Example 33.11

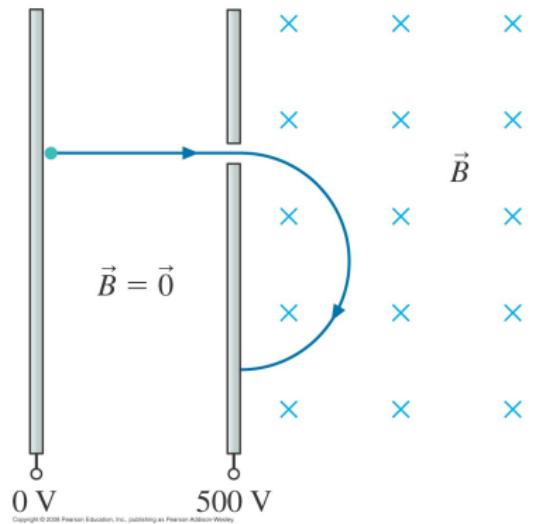

- We can do the electric field part using conservation of energy:

$$K_f + qV_f = K_i + qV_i$$

$$K_f + qV_f = 0 + q(0)$$

Copyright 02008 Pearson Education, Inc., publishing as Pearson Addison Wesley

Example 33.11

- We can do the electric field part using conservation of energy:

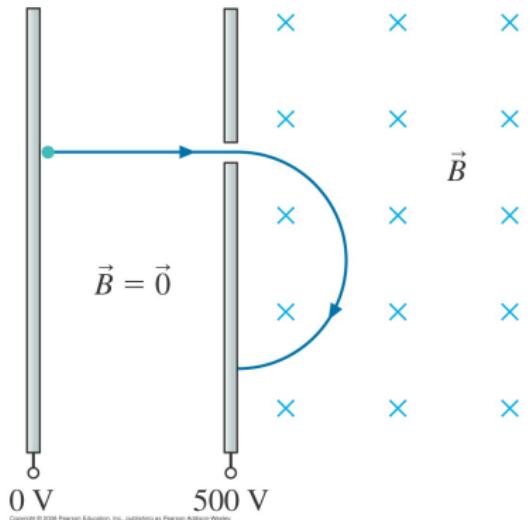

$$K_f + qV_f = K_i + qV_i$$

$$K_f + qV_f = 0 + q(0)$$

$$\frac{1}{2}mv_f^2 + (-e)V_f = 0$$

Copyright 02008 Pearson Education, Inc., publishing as Pearson Addison Wesley

Example 33.11

- We can do the electric field part using conservation of energy:

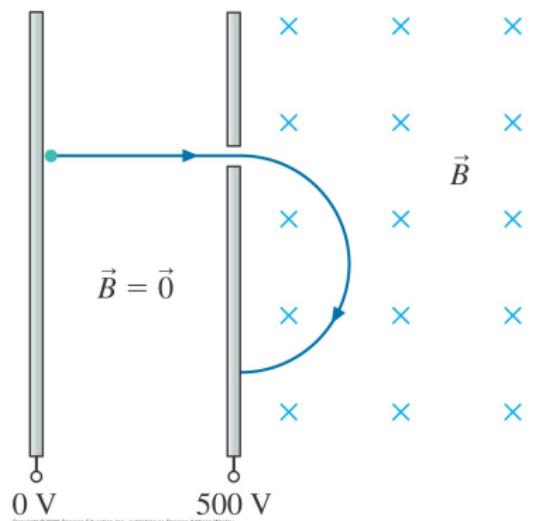

$$K_f + qV_f = K_i + qV_i$$

$$K_f + qV_f = 0 + q(0)$$

$$\frac{1}{2}mv_f^2 + (-e)V_f = 0$$

$$v_f = \sqrt{\frac{2eV_f}{m}} = 1.33 \times 10^7 \text{ m/s}$$

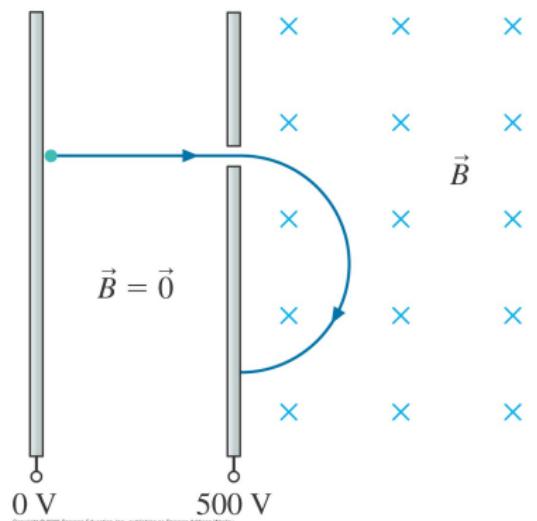

Example 33.11

- We know that one orbit would take 4ns, therefore the frequency is

$$f = \frac{1}{4\text{ns}} = 2.5 \times 10^8 \text{ Hz}$$

Example 33.11

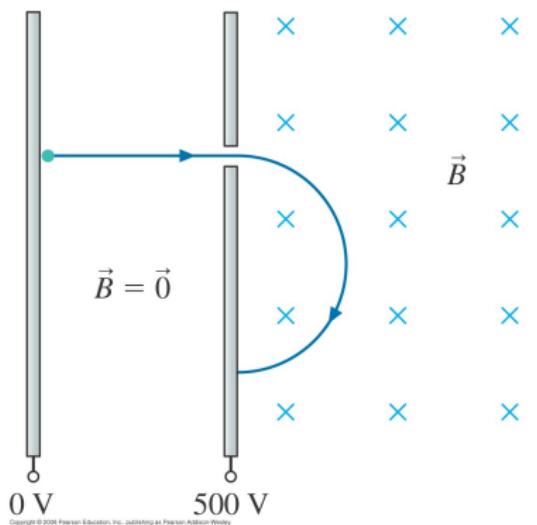

- We know that one orbit would take 4ns, therefore the frequency is

$$f = \frac{1}{4\text{ns}} = 2.5 \times 10^8 \text{ Hz}$$

$$f = \frac{qB}{2\pi m}$$

Example 33.11

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison Wesley

- We know that one orbit would take 4ns, therefore the frequency is

$$f = \frac{1}{4\text{ns}} = 2.5 \times 10^8 \text{ Hz}$$

$$f = \frac{qB}{2\pi m}$$

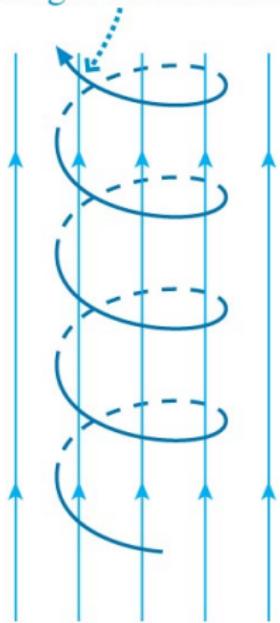

$$B = \frac{2\pi mf}{e} = 8.94 \times 10^{-3} T$$

- The radius is then

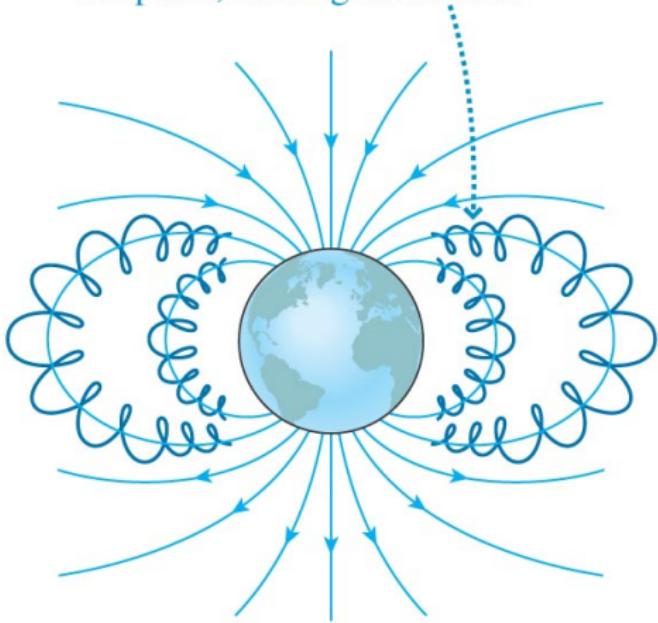

$$r = \frac{mv}{qB} = 8.5 \text{ mm}$$

Example 33.11

(a) Charged particles spiral around the magnetic field lines.

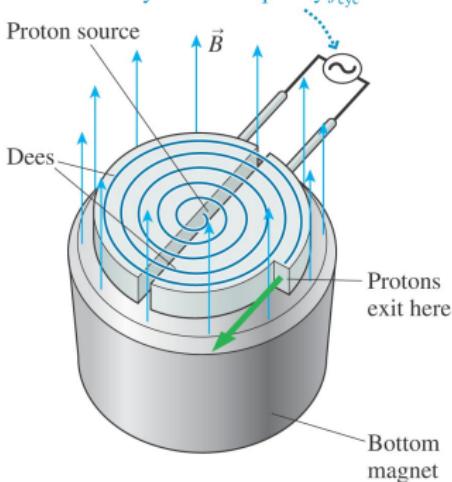

(b) The earth's magnetic field leads particles into the atmosphere near the poles, causing the aurora.

- 18500A current
- 520MeV (particle speed is 225000km/s)
- accelerates 600 trillion particles (protons) per second

Magnetic Forces on Current-Carrying Wires (33.8)

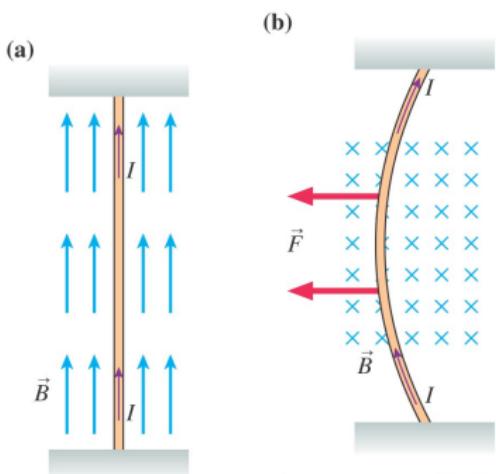

There's no force on a current parallel to a magnetic field.

A current perpendicular to the field experiences a force in the direction of the right-hand rule.

- We have seen the effect of placing two current-carrying wires close to each other (likes attract, opposites repel).

- We have seen the effect of placing two current-carrying wires close to each other (likes attract, opposites repel).
- Now it is time to quantify this magnetic force.
- A magnetic field parallel to a current exerts no force, perpendicular fields exert maximum force - makes sense from our knowledge of moving charges.

Magnetic Forces on Current-Carrying Wires

There's no force on a current parallel to a magnetic field.

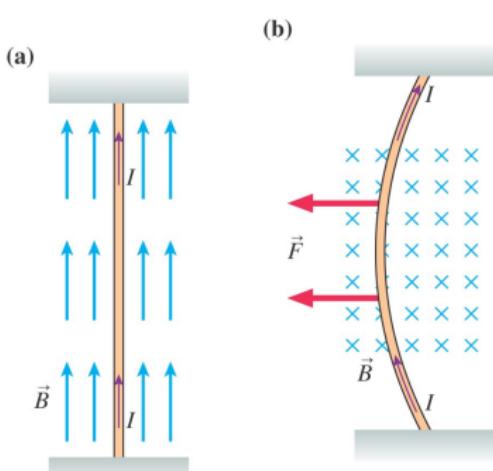

A current perpendicular to the field experiences a force in the direction of the right-hand rule.

- Let's get the force in terms of current, instead of moving charges. The current in a segment of wire of length L is charge q moving through the wire divided by the time it takes Δt :

$$q = I\Delta t = I \frac{L}{v}$$

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

Magnetic Forces on Current-Carrying Wires

There's no force on a current parallel to a magnetic field.

A current perpendicular to the field experiences a force in the direction of the right-hand rule.

- Let's get the force in terms of current, instead of moving charges. The current in a segment of wire of length L is charge q moving through the wire divided by the time it takes Δt :

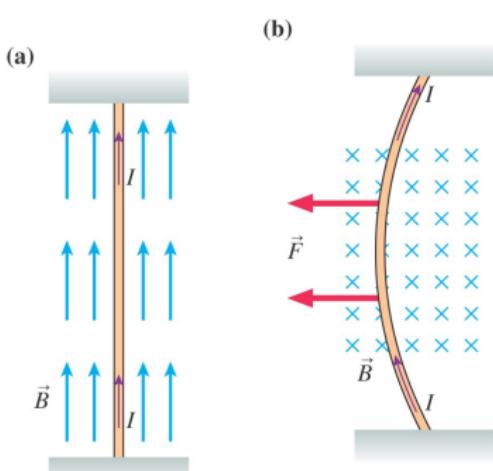

$$q = I\Delta t = I\frac{L}{v}$$

- This means that

$$IL = qv$$

- Substituting into the force equation gives

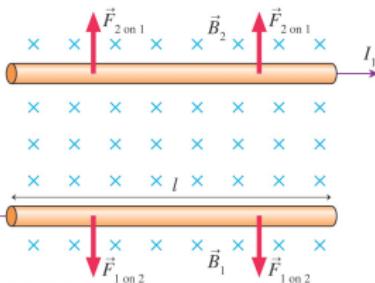

$$\vec{F}_{\text{wire}} = q\vec{v} \times \vec{B} = IL \times \vec{B}$$

Force Between Two Parallel Wires

(a) Currents in same direction

(b) Currents in opposite directions

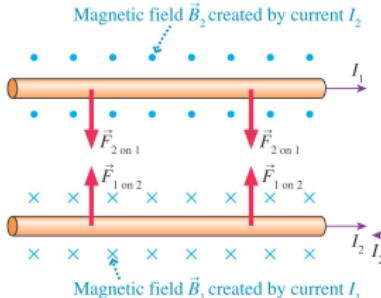

- For the specific case of two parallel wires spaced d apart, we know that the magnetic field from a “long” wire at distance d is

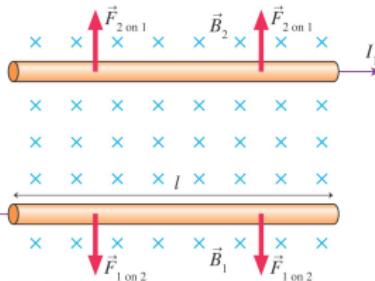

$$B = \frac{\mu_0 I}{2\pi d}$$

Force Between Two Parallel Wires

(a) Currents in same direction

(b) Currents in opposite directions

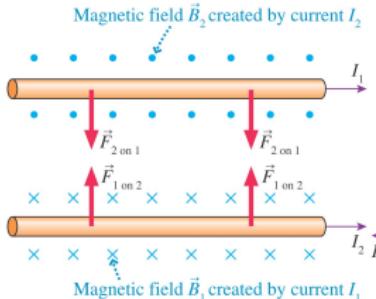

- For the specific case of two parallel wires spaced d apart, we know that the magnetic field from a “long” wire at distance d is

$$B = \frac{\mu_0 I}{2\pi d}$$

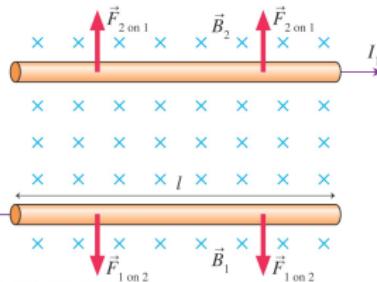

- A field of this strength is generated at the position of the second wire by the first and vice versa.

Force Between Two Parallel Wires

(a) Currents in same direction

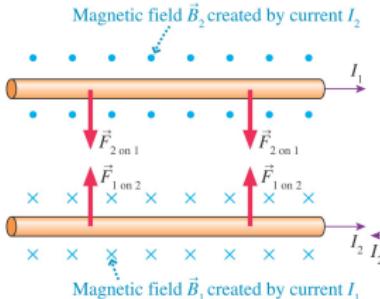

(b) Currents in opposite directions

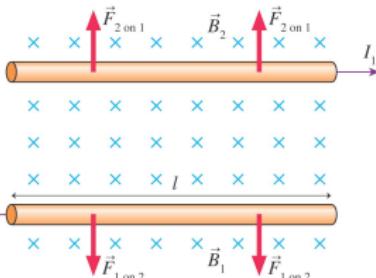

- Using the right-hand-rule (and some acrobatics) you can see why opposites repel and like directions attract.

Force Between Two Parallel Wires

(a) Currents in same direction

(b) Currents in opposite directions

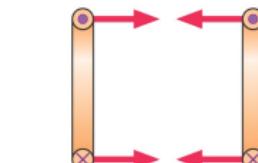

- Using the right-hand-rule (and some acrobatics) you can see why opposites repel and like directions attract.
- The field is the same everywhere along the parallel wires. The force on the upper wire is

$$F = I_1 L B_2 = I_1 L \frac{\mu_0 I_2}{2\pi d} = \frac{\mu_0 L I_1 I_2}{2\pi d}$$

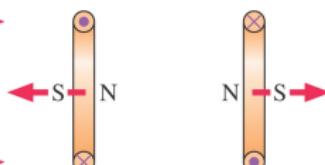

Forces and Torques on Current Loops (33.9)

(a) Parallel currents attract, opposite currents repel.

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

(b) Opposite poles attract, like poles repel.

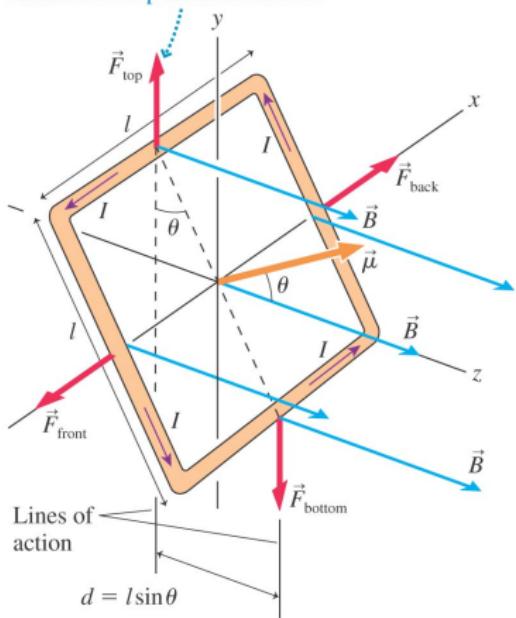

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

- You could see current carrying wires as repelling or attracting because of the alignment of their poles.

Torque on a Current Loop

\vec{F}_{top} and \vec{F}_{bottom} exert a torque that rotates the loop about the x -axis.

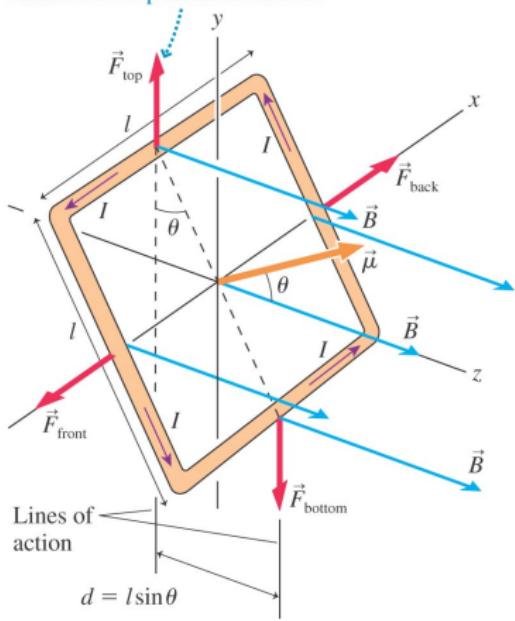

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

- Now consider a current loop in a uniform magnetic field.

Torque on a Current Loop

\vec{F}_{top} and \vec{F}_{bottom} exert a torque that rotates the loop about the x -axis.

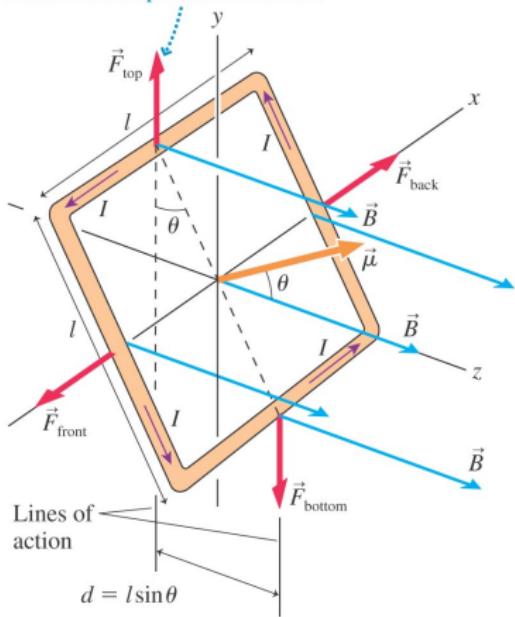

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Addison-Wesley.

- Now consider a current loop in a uniform magnetic field.
- In this configuration the forces on front and back cancel. However, the loop is not perpendicular to the field, so the forces on top and bottom do not cancel - there is a torque:

$$\tau = Fd = (ILB)(L \sin \theta) = (IL^2)B \sin \theta$$
