

CONSTANT ACCELERATION SAMPLE PROBLEM

A car is travelling 100 km/h when it starts to brake. The car slows at a constant rate until its speed is 70 km/h. When it reaches 70 km/h it is 24 m from the point where it started slowing. How long does it take the car to slow from 100 km/h to 70 km/h and what is the car's braking acceleration? Mass of the Car = 1.6×10^3 Kg

<p>Part 1: Motion Diagram</p> <p>Diagram showing a car starting at 100 km/h (v_i) and slowing to 70 km/h (v_f) over a distance $d = 24$ m. An arrow labeled a points to the left, indicating negative acceleration. The starting position is $x=0$ and the ending position is $x=d$.</p>	<p>Part 1: Sketched Graph for Velocity vs. Time</p> <p>Graph showing Velocity (km/h) vs. Time (s). The velocity starts at 100 km/h and decreases linearly to 70 km/h. The area under the line is shaded yellow and labeled $x-x_0 = 24$ m.</p>
<p>Part 2: Tables and Unit Conversions</p> <p>known: v_i, v_f, d</p> <p>to find: t, a</p> <p>$(100 \text{ km/h}) \left(\frac{1 \text{ h}}{3600 \text{ s}} \right) \left(\frac{1000 \text{ m}}{1 \text{ km}} \right) = \frac{100}{3.6} \text{ m/s} = 27.78 \text{ m/s}$</p> <p>$(70 \text{ km/h}) = \frac{70}{3.6} \text{ m/s} = 19.44 \text{ m/s}$</p>	<p>Part 2: Equations</p> $d = v_{\text{avg}} t = \frac{v_i + v_f}{2} t$ $v_i t + \frac{1}{2} a t^2 = d$ <hr/> <p>Part 3: Algebra and Substitution Solve for t and then a:</p> <p>$v_{\text{avg}} = 23.61 \text{ m/s}$</p> <p>$t = d/v_{\text{avg}} = 24 \text{ m} / 23.61 \text{ m/s} = 1.017 \text{ s}$</p> $a = \frac{d - v_i t}{t^2} = \frac{24 \text{ m} - (27.79 \text{ m/s})(1.017 \text{ s})}{(1.017 \text{ s})^2} = -4.19 \text{ m/s}^2$ <p>ANSWER $a = -4.19 \text{ m/s}^2 = -4.2 \text{ m/s}^2$ (with proper sig. fig.)</p>
<p>Part 4: Units Check,</p> <p>$\text{m/s}^2; (\text{m/s})(\text{s})/\text{s}^2 = \text{m/s}^2$</p>	<p>reasonable?:</p> <p>4.2 m/s^2 is about 1/2 the acceleration of free fall. seems ok.</p>
<p>Part 5: Description of the Net Force Causing the Acceleration and its Calculation based on a knowledge of the Acceleration</p> <p>The braking force may be due to locking the wheels and having them rub against the track or to a friction pad dragging on the center of the track.</p> <p>$F = ma = (1.6 \times 10^3 \text{ Kg})(-4.2 \text{ m/s}^2) = -6.8 \times 10^3 \text{ N}$</p> <p>The force is negative since a is negative.</p>
