A string is a string containing rest of string or rest of string containing last first char.

Example:

```
"banana"
```

recursive case

```
"b" + "ana"
```

base case

```
"b"
```

In Python:

```
def contains_first_char(aString):
    return aString[0] + aString[1:]

str = "banana"
print(contains_first_char(str))
```

Result:

```
ba
```
