Numeral classifiers in Halkomelem

Donna B. Gerds, Mercedes Q. Hinkson, Thomas E. Hukari
Simon Fraser University, Northwest Indian College, University of Victoria

Of the over one hundred lexical suffixes in Halkomelem Salish, around thirty function as numeral classifiers. This paper discusses the syntax and semantics of Island Halkomelem numeral classifiers. The combination of numeral plus classifying lexical suffix yields a form that can be used attributively or anaphorically. We outline the classificatory system, discussing the meaning of each suffix and the nouns that it classifies. Specific lexical suffixes classify key elements of Salish culture, including people, fish, waterfowl, plants, houses, and canoes. However, most inanimate objects are classified on the basis of their shape. New items get added to the system according to their shape or function.

1 Introduction

This paper focuses on lexical suffixes used as numeral classifiers in Halkomelem, a Central Salish language. As has been noted for other Salish languages, Halkomelem uses a sub-set of lexical suffixes as numeral classifiers. Of the approximately 120 lexical suffixes in this language, around thirty are used as classifiers. They attach to numerals and quantifiers ('how many', 'many') but not to articles or demonstratives.

---

1 We would like to Wayne Suttles for sustained advice on the semantics of lexical suffixes. Thanks also to Alexandra Aikhenvald, Michelle Parent, and Charles Ulrich for comments and corrections. Remaining errors are our own responsibility. A shorter version of this paper is published as section 2 of Gerds and Hinkson (to appear), which also discusses the historical original of the Halkomelem classifying suffixes.

2 Halkomelem is spoken in the vicinity of Vancouver, British Columbia, and on Vancouver Island. Unless otherwise indicated, data come from our field research on the Island dialect of Halkomelem. We would like to thank the speakers who have helped us with this project: Wilfred Aleck, Cecelia Alphonse, Leonard Edwards, Hazel Good, Arnold Guerin, Margaret James, Ruby Peter, Dora Sampson, Steve Sampson, Sr., Wilfred Sampson, and especially Theresa Thorne. Funding for our research has come from Jacobs Fund, SSHRC, Simon Fraser University, and the University of Victoria.

3 Abbreviations used in this paper are: ASP aspect, AUX auxiliary, BEN benefactive, CON connective, CS causative, DT determiner, EMPH emphatic, ERG ergative, EVID evidential, FUT future, LCTR limited control transitive, MID middle, NEG negative, NM
There are three dialects of Halkomelem—Island, Downriver, and Upriver. This topic has been previously addressed in Island Halkomelem by Leslie (1979), who briefly illustrates six suffixes, and Hukan & Peter (1995), who give an extensive list of lexical suffixes and illustrate many of them with numerals. Suttles (in preparation) identifies seventeen suffixes appearing on numerals in Downriver Halkomelem and gives partial paradigms, and Shaw et al. investigate a sub-set of Suttles' suffixes, but give complete paradigms, commenting on details of phonology. Galloway (1993) identifies twenty suffixes in Upriver Halkomelem and sets up a useful typology of features. For example, he asks for each suffix: can it also be used on noun and verbs; can it be used with kwii 'how many?'; what numbers can it be used with, and is it optional or obligatory?

This paper reports on our on-going research on lexical suffixes in Halkomelem. It is the first systematic look at the topic from the typological point of view of a classificatory system. Like previous researchers, we collected examples of the use of numeral classifiers from texts and then elicited paradigms and sought information about the sort of meanings the classifiers convey. In addition, we worked backwards from a list of nouns (both native and borrowed) to see how each fit into the classifier system. Also, we used a catalog of pictures designed to elicit subtleties in the use of classifiers. We worked with individual speakers and groups of speakers. What we found is that our consultants had excellent control of the classifier system. They unhesitatingly knew whether a classifier should be used or not and if so which one, even for modern objects that they had never heard referred to in Halkomelem. They were almost always in agreement about what classifiers could be used for a noun in a particular context and had a clear sense of the semantic nuances when options were available. They could easily count out a paradigm with a classifier extending to
numbers as high as ninety-nine though they also commented on the unlikelihood of a situation arising that would require precisely counted higher numbers of certain objects. There was, however, some phonological differences between speakers, manifested in differences in vowel quality, stress, and length, and also in the glottalization of resonants. We put aside phonological aspects of this domain for future research.

In this report, we first briefly illustrate the range of functions of lexical suffixes, situating numeral classification with respect to other uses of the suffixes. An important point that we feel has been overlooked in previous studies is that all suffixes that appear on numerals are not in fact classifiers. This is in part what the typology of Galloway reveals. Once we delineate a class of true classifiers, we can make much more precise comments about the morphosyntax (section 2) and the semantics (section 3) of numeral classifiers. The system that emerges from the investigation of the meaning of the suffixes and the nouns that they classify matches our expectations of classificatory systems based on cross-linguistic typology.

1.1 Compounding and classifying lexical suffixes

Lexical suffixes are bound forms with the meanings of nouns (Kinkade 1963:352). Today they usually bear little or no resemblance to free-standing nouns of the same or similar meaning: 4

(4) =alos `eye' qalam `eye'
=šon `foot, leg' šekša `foot'
=exon `arm, wing' felšw `arm, wing'
=evtq* `building, room' lešāth `house'
=eyot `baby, child' qeq `baby'

However, comparative evidence shows that lexical suffixes derive historically from nouns (Egesdal 1981, Mattina 1987b, Carlson 1990, Kinkade 1998).

---

4 Each suffix appears in a variety of phonological shapes: with and without a full vowel (correlating with stress), with and without glottal stops or glottalization of resonants, with and without a connective morpheme between the stem and the suffix. In addition, there are sometimes truncated forms used in older, frozen contexts. So, for example, the suffix meaning 'mouth, edge, blade' variously appears as =uŋaθ, =uθ, =uŋθan, =θan, =θiθan, or =θ. We will represent the Halkomelem suffix by its simplest form, and we will not segment the connective elements — vi, vi, and vi — when representing the Halkomelem data.

While we have found considerable variation both within the speech of individuals and across speakers, certain phonological processes generally take place. Many lexical suffixes of the shape =VCVX trigger vowel reduction or loss in CVC roots. This is may be stress conditioned although a detailed study is yet to be carried out. Lexical suffixes of the shape =CVX generally trigger vowel reduction (as opposed to loss).
Lexical suffixes developed from nominal roots used as the right-hand member of a compound. The historical picture in Salish is that the second element in a compound was phonologically shortened and eventually became a bound form. New, longer, free-standing forms were invented; these often themselves contain the original form, which is now a lexical suffix.

Gerds and Hinkson (1996), propose that the functions of lexical suffixes can be organized according to the following cline: **compounding lexical suffix > classifying lexical suffix.** The lexical suffix has the lexical and semantic properties of a noun when used in compounding functions, but it becomes acategorial and semantically bleached when used as a classifier. Thus the suffixes grammaticize from a lexical entity to a grammatical one. We see these two types of function at work in the use of lexical suffixes today.

The most transparent use of lexical suffixes occurs when they are suffixed to a noun, verb, or adjective root to derive a noun.5

\[
\begin{align*}
(5) & \quad \text{sa}k"=\text{e}n=\text{wtx} \quad \text{‘barn’} \quad \text{[grass=building]} \\
& \quad \text{tik}"=\text{c}=\text{p} \quad \text{‘yea tree’} \quad \text{[bow=plant]} \\
& \quad \text{i}w\text{y}a\text{t}=\text{e}=\text{wtx} \quad \text{‘church’} \quad \text{[pray=building]} \\
& \quad \text{?i}w\text{at}=\text{w} \quad \text{‘pajamas’} \quad \text{[sleep=garment]} \\
& \quad \text{p}\text{q}=\text{en}x \quad \text{‘a white flower’} \quad \text{[white=flower]} \\
& \quad \text{x}=\text{\text{t}aq}=\text{w} \quad \text{‘cougar’} \quad \text{[PR-long=tail]} \\
\end{align*}
\]

This use is still productive and is a common means for creating vocabulary to accommodate new items.

Lexical suffixes also commonly appear in complex predicates. That is, they are attached to a verb stem and the resulting compound functions syntactically as the main predicate of a clause. They can express a theme (6) or an oblique relation, such as locative or instrument (7).

\[
\begin{align*}
(6) & \quad \text{q}=\text{c}=\text{yan} \quad \text{‘set a net’} \quad \text{[go.into.water=net]} \\
& \quad \text{saw}=\text{w}s \quad \text{‘search for a lost person’} \quad \text{[seek=body]} \\
& \quad \text{t}=\text{aq}=\text{w} \quad \text{‘shear wool’} \quad \text{[cut=animal hair]} \\
\end{align*}
\]

\[
\begin{align*}
(7) & \quad \text{\text{q}t}=\text{a} \text{\theta} \text{an} \quad \text{‘walk along (a shore etc.)’} \quad \text{[go.along=mouth]} \\
& \quad \text{\text{q}t}=\text{w} \text{\text{a}c} \quad \text{‘go around end of lake’} \quad \text{[go.along=bottom]} \\
& \quad \text{\text{q}a}=\text{\text{t}i}=\text{w} \text{\text{n}t} \quad \text{‘accompany him’} \quad \text{[add=foot-TR]} \\
\end{align*}
\]

Lexical suffixation of the theme leads to an intransitive construction that parallels compounding noun incorporation (Gerds 1998).

---

5 Throughout this paper, we assume, following Sutlles (in preparation), that Halkomelem has the categories noun, verb, and adjective. See Czaykowska-Higgins & Kinkade (1998:35-37) for a history of the debate concerning categories in Salish. Also see Monler (2001) for a presentation of the evidence for the category adjective in the nearby language Klalam.
(8)  ni?  can  škʷ=əyəl.  
    AUX  1SUB  bathe=baby. 
    'I bathed the baby.'

Halkomelem person marking follows a split ergative pattern. First and second person subjects in main clauses are marked by clitics in Wackernagel's position while objects are marked by verbal suffixes. Third person subjects in transitive main clauses determine ergative agreement:

(9)  ni?  šəkʷ-ət-əs  to  sənəʔ  to  qeq. 
    AUX  bathe-TR-3ERG  DT  woman  DT  baby 
    'The woman bathed the baby.'

Word order is usually VSO, though VOS is also possible. Subject and object noun phrases are not marked for case. Determiners mark deixis and gender. Transitive verbs are marked with one of several suffixes: -at 'control transitive', -n(əx) 'limited control transitive', -st(əx) 'causative', etc. We see that the clause in (9) is surface-transitive since the verb is marked for transitivity, the two noun phrases appear without case, and the subject determines ergative agreement. The parallel clause with lexical suffocation is transitive:

(10)  ni?  škʷ=əyəl  la  sənəʔ. 
    AUX  bathe=baby  DT  woman 
    'The woman bathed the baby.'

The verb in the above example lacks a transitive suffix and an ergative agreement suffix. We refer to the above uses of lexical suffixes as compounding. In each of the above cases, the lexical suffix stands in for a noun, either as a head of a compound, as in (6), or as a noun argument of the verb, as in (7).

Lexical suffixes can also be used as classifiers. When lexical suffixes are used as classifiers on nouns or adjectives, the base, not the lexical suffix, is the head of the resulting word.

(11)  s-əxʷəm=əws  'body odor'  (PR-odor=body) 
    šəqʷ=əmələm  'tall' (of people)  (long=long.object) 
    c-əxʷe=ələc  'black-haired'  (PR-black=hair) 
    ʔiy=əs  'happy'  (good=face) 
    xʷ-ʔi=əmən  'loud'  (PR-big=throat)

---

6 The determiners include: ʔə, 'general in view'; k, 'general out of view', əθə, 'feminine singular in view', ʔə, 'feminine singular out of view', ʔ, 'indefinite', and X, 'proper noun' (oblique case only).
7 Sometimes the intransitive verb may have a syntactically active theme manifested as the oblique object of an intransitive. This is not addressed in this paper.
Lexical suffixes can also be used as classifiers on verbs. In a classifying construction, the verb takes a transitive suffix, and a free-standing object that references the same entity as the lexical suffix.

(12) \[\text{ni'?} \quad \text{t}^{\text{g}x}=\text{wil}-\text{t-as} \quad \text{t}'\text{a} \quad \text{lapat.}\]
    AUX  wash=classifier-TR-3ERG DT   cup
    'She washed the cups.'

This is a surface-transitive construction, as evidenced by the third-person ergative agreement, and thus contrasts with the example of compounding lexical suffixation in (10) above. See Gerdt and Hinkson (1996) for further discussion on this construction.

In sum, we see that lexical suffixes are used in two types of constructions—compounding and classifying. Most lexical suffixes can appear in either type of construction, though a few suffixes are restricted to only one type or the other.

1.2 Numerals and suffixes

Our research has shown that most of the lexical suffixes that are used on verbs or adjectives can also be used on numerals, if a context can be provided to make sense out of the resulting combination. It is important to note, however, that the resulting constructions do not all constitute classifier expressions. Many of these combinations are simply compounds, that is, the polysynthetic equivalent of a phrase consisting of a numeral and a noun, which are then used as noun phrases, attributively as modifiers, or as quantifying expressions (often referred to as measure words). So our first task, before proceeding, is to set criteria for telling compound numeral suffixes from classifying numeral suffixes. Aikhenvald (2000:114–120) provides the methodology for doing this.

First, we can exclude all suffixes designating mathematical concepts and measure words: for example, =st'ë? 'ten', =el 'times', =šëx'ën 'yard', =šet 'fathom', and =wunx* 'year' (from 'fish run', 'season').

(13) \[\text{ni-i-i'?} \quad \text{k'ëta} \quad \text{k}^{\text{as}x}=\text{ak}^{\text{as}x} \quad \text{t}^{\text{aw}ni} \quad \text{ni}?\]
    AUX  four-times DT swim-IMP DT AUX
    ?o \quad \text{t}^{\text{e}y} \quad \text{nâ} \quad \text{nac}a'? \quad \text{ka}?a?.
    OBL   DT one lake
    'He bathed four times at this one lake.'

(14) \[\text{w} \quad \text{t}^{\text{as}x}=\text{wunx}^{*} \quad \text{ce}? \quad \text{ni'?} \quad \text{nëm} \quad \text{con} \quad \text{sk}^{*} \quad \text{ul-stax}^{*}.
    \text{now-seven=year} \quad \text{FUT} \quad \text{and} \quad \text{go} \quad \text{ISUB} \quad \text{school-CS}
    \text{I'll send him to school when he is seven years old.'}
Second, we can exclude all suffixes that never appear in a sortal or mensural relation with a free-standing noun. By this criterion, we can exclude several somatic suffixes: =cas 'hand'

\[=cas \text{ 'hand'}\]

\[-alwics \text{ 'finger'}, =\text{šan} \text{ 'foot'}, =alqan \text{ 'nose'} (\text{used in counting points}), =\text{axan} \text{ 'side'} (\text{used in describing shapes, e.g. a triangle}), \text{and } =\text{ayəʔə} \text{ 'mouth, edge'} (\text{used in counting prongs on spears}).\]

(15) \text{i%x}=\text{ayəʔə} \text{θ} \text{θa} \text{sənəms tə swi}w\text{łos nəʔət yəʔiñəš.}\]

\text{three=edge DT spear-3POS DT young.man there PR-walk-IMP}

'The young man going by has a three-pronged spear.'

It is clear that these suffixes are used as compounding lexical suffixes. The thing being counted is the suffix itself and not the noun referred to by the suffix. For example, in (16), 'tires' (\text{>'feet'}) not 'cars' are being counted.

(16) \text{tx} \text{̓-li%=xən ʔa\text{̑}}\text{iθa sənx̗%ə.}\]

\text{only-three=foot only DT canoe}

'The car only has three tires.'

A parallel construction in English would be one like 'four-legged animal'.

In contrast, in the case of a sortal classifier, the noun has the same referent as the suffix:

(17) \text{i%x}=\text{əqan əθəm}\]

\text{three=container box}

'three boxes'

In many instances, the lexical suffix emphasizes one feature of the noun, but the construction nevertheless refers to the noun as a whole:

(18) \text{iqəc̓s}=\text{məl}θ əl

\text{five=long road}

'five roads'

Lexical suffixes can also be used in mensural expressions. Mensural classifiers are determined by the quantity of the object or the arrangement that it occurs in.

(19) \text{i%x}=\text{əqan səqwəθ}\]

\text{three=container potato}

'three sacks of potatoes'

---

8 The suffix for 'hand' is used in some Salish languages as a measure word indicating 'handful' or 'cupful'.
In such examples, it is the head noun that is being counted, and thus true classifying lexical suffixes differ from compound ones such as the 'three-tired car' illustrated in (16) above.

Using these criteria leaves us with a core set of suffixes that function as numeral classifiers. These will be explored in the subsequent sections.

2 The morphosyntax of numeral classifiers

Numerals are adjectives in Halkomelem. In NPs, they appear between determiners and head nouns, like other adjectives, and they do not head an NP.

(20) ʔəni-stəxʷ č kʷθə liixʷ *(θəm)!  
come-CS:3OBJ 2SUB DT three box  
'Bring the three *(boxes)!'  

(21) ʔəni-stəxʷ č kʷθə θi *(θəm)!  
come-CS:3OBJ 2SUB DT big box  
'Bring the big *(box)!'  

Adjectives, including numerals, can take lexical suffixes. These can be used attributively, like plain adjectives, to modify a noun as in (20) and (21), but they can also be used anaphorically—without a head noun.

(22) ʔəni-stəxʷ č kʷθə liixʷ=qən *(θəm)!  
come-CS:3OBJ 2SUB DT three-container box  
'Bring the three (boxes)!'  

(23) ʔəni-stəxʷ č kʷθə θc=qən *(θəm)!  
come-CS:3OBJ 2SUB DT big-container box  
'Bring the big (box)!'  

Question (24) lacks a lexical suffix (and thus we see that numeral classifiers are often omitted in Halkomelem), while the reply in (25) uses the lexical suffix, but omits the head noun, which would be regarded as redundant in this context.

(24) ʔi ʔə liixʷ kʷθi səniqʷəl ʔələp?  
AUX Q three DT:2POS canoe.PL 2PL  
'Do you all have three canoes?'  

(25) ʔəwa, ʔəwəm=qəl ʔəl.9  
NEG just two-canoe just  
'No, just two.'  

9 The bound root —θəm- is an older form for 'two.'
The answer without the classifier is possible but less preferred.

Within the noun phrase, the numeral plus lexical suffix will appear between the determiner and the noun phrase, as in (22) above. The noun phrase can function in any syntactic position usually occupied by a noun phrase. For example, it can function as subject (26), object (27), or an oblique marked phrase (28).\(^\text{10}\)

(26) \(\text{n}i\)? \(\text{q}^\text{w}\text{y}^\text{s}^\text{la}^\text{s}\) \(\text{k}^\text{w}^\text{th}^\text{a}\) \(\text{x}^\text{a}^\text{th}^\text{i}^\text{na}\) \(\text{q}^\text{e}^\text{l}^\text{ami}\).\)
AUX dance DT four.people girl.PL
‘Four girls danced.’

(27) \(\text{n}i\)? \(\text{ct}\) \(\text{q}^\text{w}^\text{m}^\text{-at}\) \(\text{k}^\text{w}^\text{th}^\text{a}\) \(\text{y}^\text{s}^\text{e}^\text{la}-\text{na}^\text{c}\) \(\text{k}^\text{w}^\text{m}^\text{la}\)\.
AUX IPL.SUB uproot-TR DT two=bottom root
‘We dug up two roots.’

(28) \(\text{?'i}^\text{x}^\text{am}^\text{can}\) \(\text{ce}\)? \(\text{?'e}\) \(\text{?\text{e}p}^\text{a}^\text{n}=\text{as}\).
lend 1SUB FUT OBL det ten=round
‘I will lend ten dollars.’

The head noun can be singular as in (29) or plural as in (26) above.

(29) \(\text{te}^\text{c}^\text{e}^\text{s}=\text{c}^\text{e}\) \(\text{k}^\text{w}^\text{th}^\text{a}\) \(\text{na}\) \(\text{s}^\text{c}^\text{a}^\text{m}^\text{a}q^\text{e}\).

eight=people DT 1POS great.grandchild
‘I have eight great-grandchildren.’

[Compare \(\text{s}^\text{c}^\text{a}^\text{l}^\text{a}^\text{ma}q\) ‘great-grandchildren’; \(\text{q}^\text{e}^\text{mi}\) ‘girl’.] Plural inflection, marked by the infix -\(\text{l}\) (and glottalization of resonants) or by reduplication, is in general optional in Halkomelem, especially where the context makes number clear. For some frequently used nouns such as terms for people and the larger items of material culture, marking plurality is preferred to not marking it.

Like other noun phrases, the counted noun can appear in a clause-initial focus position. The phrase serves as a predicate nominal in expressions of these sorts, followed by a determiner-headed relative clause:

(30) \(\text{k}^\text{w}^\text{in}-\text{q}^\text{a}^\text{p}^\text{e}\) \(\text{x}^\text{th}^\text{a}^\text{m}\) \(\text{k}^\text{w}^\text{a}\) \(\text{n}i\)? \(\text{?i}^\text{la}^\text{q}-\text{at}-\text{ax}\).
how.many=container box DT AUX buy-TR-2SSUB
‘How many boxes did you buy?’

\(^{10}\) Halkomelem subjects and objects are bare noun phrases, while non-terms—such as locatives, instruments, as well as themes (secondary objects) in antipassives and ditransitives—are preceded by the catch-all preposition ?\(\text{a}\). For a general introduction to Halkomelem syntax see Gerdis (1988) and Gerda & Hukari (to appear).
In addition, the numeral and lexical suffix alone can appear as a predicate adjective in clause initial position:\(^{11}\)

(31) ʾaθin=xayl  kʷθə  nə  puʔəlt.
four=canoe DT 1POS boat.PL
‘I have 4 boats.’

Like other adjectives, numerals with lexical suffixes can undergo further derivation. For example, they can take the inchoative prefix xʷə- and they can become transitive predicates through the addition of the causative suffix -st(əxʷ).

(32) xʷə-ixʷ=xamat-staxʷ  č  kʷəhs  lič-ət
become-three-part=CS:3OBJ 2SUB DT:2POS:NM cut-TR
čə sce:ltan!
DT salmon
‘Cut your salmon into three chunks!’

(33) txʷ-yassal=aləs-staxʷ  č  təšə  syəxys ʔiʔ  ʔəʔ.
only-two=loop-CS:3OBJ 2SUB DT:2POS work and good
‘It will be better if you do two more rounds in your knitting.

Thus numerals with lexical suffixes show for the most part the distributional properties of adjectives, which seem to be a subclass of adjective. The one apparent exception is the fact that numerals with lexical suffixes can be used anaphorically, appearing as the superficial head of an NP, as in (25). However, we noted this is also a feature of adjectives with lexical suffixes, as in (23). An open issue is whether these function as NP heads or as modifiers of null heads. In some instances, the use of a numeral with lexical suffixes without a head noun goes beyond contextual anaphora. The suffix =as to denote money is a notable example, as in (28), where ʔspan=as is normally construed quite specifically to mean ‘ten dollars’.

3  The Semantics of Numeral Classifiers

In this section we turn to an exploration of numeral classifiers in Halkomelem. In Table 1, we exemplify twenty-four classifying lexical suffixes found to appear on numerals in Halkomelem. We use the number lixʷ ‘three’ as the base. Suffixes are sorted by the kinds of objects they classify and glossed with a typical noun that they classify. In subsequent sections, we discuss each group of suffixes.

\(^{11}\) Halkomelem lacks a verb for ‘have’; possessive expressions like (31) are a common means of expressing this notion.

AUX IPL.SUB just only-six=people just
‘There are just six of us now.’

As has been noted by Anderson (1999), many Salish languages use reduplicated forms of numerals for counting people and animals. He reconstructs *CVC-, *CV-, and *PCV reduplication for counting people and *CV- diminutive reduplication for counting animals. This system of classification is prevalent in Interior Salish languages and also in some of the Central Salish languages, e.g. Squamish and Lushootseed. However, in Halkomelem, the only remnant of this system is with the numbers ‘one’ and ‘two’ when counting people.

(38) nəčəʔ ‘one’ nənəčəʔ ‘one person’ nəčnəčəʔ ‘one person at a time’

(39) yəsələ ‘two’ yəysələ ‘two people’ yəsyeysələ ‘two people at a time’

As seen by comparison to the numbers for ‘one’ and ‘two’ in the first column, the forms for ‘one person’ and ‘two people’ show CV reduplication with a full vowel, and glottalization of a resonant. The meanings ‘one person at a time’ and ‘two people at a time’ are indicated with double reduplication.13 These forms function as classifiers.

(40) niʔ q*als tə̚y nənəčəʔ swəʔqeʔ.
AUX speak DT one.person man
‘One man spoke.’

(41) səw tx*-yeysələ ct k*əʔəł xʷəwe
NOM-COMP only-two:people IPL.SUB indeed not-yet
niʔ-əʔ k*ənənxʷ k*ə xʷə-təsəšəʔ ct səlanəm.
AUX-IPL.SSUB take-LCTR:OBJ DT become-thirty IPL.POS year
‘So there are two of us only that have not yet reached their eightieth year.’

One other lexical suffix is used on numerals to refer to people: =e yal
‘child’ (see (10) above).

(42) təam=əyəł k*θə nə sələnəqəq.
six=child DT IPOS great-grandchild.PL
‘I have six great-grandchildren.’

---

13 The doubly reduplicated forms show CVC reduplication of the root as the first prefix and then CV reduplication is infixed into the second position. See also Lushootseed (Bates, Hess, Hilbert 1994:79).
We see though that this suffix can also be added to a form that already has the suffix =e\texteta.\textsuperscript{14}

\begin{align*}
(i) \quad & \textit{ixam=}\textit{tə=}\textit{eyl} \quad k^\text{θə} \quad nə \quad \textit{sələməq}. \\
& \text{six=}\text{people=}\text{child} \quad \text{DT} \quad \text{IPOS} \quad \text{great-grandchild.PL} \\
& \text{I have six great grandchildren.}'
\end{align*}

The plain numeral or the reduplicated forms for one or two people can also co-occur with the lexical suffix =e\texteta.\textsuperscript{15}

\begin{align*}
(44) \quad & \textit{yəsəl=}\textit{eyl} . \\
& \text{two=}\text{child} \\
& \text{two children}'
\end{align*}

\begin{align*}
(45) \quad & \textit{yeysəl=}\textit{eyl} . \\
& \text{two.}\text{RED=}\text{child} \\
& \text{two children}'
\end{align*}

This is the only case we have seen of lexical suffixes used as numeral classifiers stacking in this fashion.

Turning now to other animates, there are no generic words for 'animal', 'bird', 'fish', etc. and there are also no general classifiers for non-human animates.\textsuperscript{15} Usually, animals and birds are counted without a classifier:

\begin{align*}
(46) \quad & \textit{təcəs} \quad \textit{pəpəl}^\text{\texteta} = \textit{məx}^\text{\texteta} - \textit{təm} \quad \textit{mausməs}. \\
& \text{eight} \quad \text{DT} \quad \text{squeeze=breast-PAS} \quad \text{cow.PL} \\
& \text{There were eight cows to milk.}'
\end{align*}

Furthermore, Halkomelem, unlike many Salish languages (Anderson 1999) does not use reduplication for counting animals. However, three lexical suffixes are regularly used for counting certain types of animals. The suffix =a?q' 'head' is used to count fish, fish heads, and round and cylindrical-shaped sea-life such as chitons, clams, oysters, sea urchins, and sea cucumbers.\textsuperscript{16}

\begin{align*}
(47) \quad & \textit{ni?} \quad \textit{can} \quad x^\text{\texteta} \textit{sam=}\textit{as-t} \quad k^\text{θə} \quad \textit{ixəm=}\textit{a?q}' \quad \textit{sce:}\textit{tən}. \\
& \text{AUX} \quad \text{SUB} \quad \text{smoke=}\text{face-TR} \quad \text{DT} \quad \text{six=}\text{head} \quad \text{salmon} \\
& \text{I smoked six fishheads.'}
\end{align*}

\textsuperscript{14} Hukari & Peter (1995) also notes the form yeysəle\texteta 'have two children', which shows the reduplicative form for 'two people' as well as the lexical suffix.

\textsuperscript{15} This is not to say that there are no words for types of animals, birds, etc.

\textsuperscript{16} Note on this example the suffix on the verb refers to 'face' while the suffix on the numeral refers to 'head'. This shows that verb classifiers and numeral classifiers diverge.
(48) \( \text{lx}^* = q \quad \text{tk}^* \text{tx} \quad k^* \theta \quad n \quad n \text{?altan.} \)

three=head oyster DT AUX IPOS food

'Four oysters is what I had to eat.'

The suffix \( =q \) is also used for round objects and appears in the section on shape classifiers below.

The lexical suffix \( =w \) 'body' is used to count waterfowl and chickens.

(49) \( \text{n} \quad \text{can} \quad \text{lam-} \text{n} \quad k^* \theta \quad \text{lx}^* = w \quad \text{ma} q^* \).

AUX 1SUB look-LCTR DT three=body duck

'I saw three ducks.'

In addition, as Suttles (in preparation) notes, rabbits and other small game can be counted with \( =w \). We have found that carcasses of larger game animals and domestic animals, such as elk, sheep, and horses can also be counted with this suffix.

(50) \( \text{n} \quad \text{can} \quad k^* \text{el} \quad k^* \theta \quad \text{km} = i \quad \text{sq} \quad \text{qwe} \).

AUX 1SUB shoot-TR DT four=body rabbit

'I shot four rabbits.'

(51) \( \text{lx}^* = w \quad \text{samiya} \quad ? \quad \text{han} \quad \text{cow-} \text{n} \quad k^* \theta \quad \text{swayeq?} \).

three=body deer,PL and go-down-LCTR-3ERG DT man

'The man managed to bring down three deer form the mountains.'

One speaker told us that dogs when they were alive could be counted with \( =ela \), the suffix used for counting people, but they would be counted with \( =w \) when they were dead.

(52) a. \( \text{txam} = e \quad \text{te} \quad \text{sq} \quad \text{qwe} \quad \text{amey} \).

six=people DT dog,PL

'There are six dogs.' (alive)

b. \( \text{txam} = w \quad \text{te} \quad \text{sq} \quad \text{qwe} \quad \text{amey} \).

six=body DT dog

'There are six dogs.' (dead)

Dogs had special status in Coast Salish culture since their hair was used to make blankets. Amoss (1993:26–27) points out that wool dogs were fed dried meat or fish, traveled with the family in the canoe, and were a measure of a woman's wealth. Other animals cannot be counted with \( =ela \). So, although there is no special classifier for dogs in Halkomelem, as there is, for example, in Jacaltec (Craig 1986), they nevertheless are treated distinctly from other animals.
Suttles (in preparation) mentions the use in Downriver Halkomelem of the suffix =elgt meaning 'catch, game' in words like tow=elgt 'lose a fish, miss a shot, qx=elgt 'have a big catch', k'ín=elgt 'how many caught'. One Island speaker we worked with suggested that game could be counted with this suffix: ix'om=elgt means 'six pieces of game' and ?apanelgt means 'ten pieces of game'. But she suggested that the suffix was old-fashioned and preferred using the suffix =iw for caught birds and animals.

3.2 Classifying the natural environment

Several lexical suffixes are used to count elements of the natural environment, including plants, firewood, and ground.

<table>
<thead>
<tr>
<th>TREE</th>

Table 3 Suffixes denoting elements of the natural environment.

The suffix =alp refers to trees, bushes, and plants.

(53) ni? can pan-at ʔa sxeθi:n=lp ʔpey.
AUX 1SUB plant-TR DT four=plant cedar
'I planted four cedars.'

16
Two other suffixes are used for counting plants. The lexical suffix =neg
‘bottom’ is used to count tubers such as potatoes, carrots, and camas, as well as
tree roots.

(55) 1ox =neg sqewθ ni? qa-omq-tam.
three=bottom potato AUX dig.up-PAS
'There were three potatoes dug up.'

(56) əpe:n =neg el na spe:nx.
ten=bottom DT IPOS camas
'I got ten camas.'

Also, the suffix =enx ‘plant part’ is used to count sprouts and shoots, as well
as ears of corn or tomatoes when they are on the plant.

(57) əpe:nx tθa sqewθ ni? cim\q.m.
ten=plant.part DT potato AUX grow
'Ten potatoes sprouts grew.'

(58) lx =enx tθa k\n
three=plant.part DT corn
'three ears of corn'

Firewood is counted with the lexical suffix =alcap.

(59) lx =alcap xpey ni? yaq-tam.
three=firewood cedar AUX burn-pas
'Three pieces of cedar were burned.'

(60) əpen =alcap kθa na syal ni? x\a-say\q.
ten=firewood DT IPOS firewood AUX become-ready
'I have ten blocks of firewood ready.'

This suffix can refer to single pieces of wood for the fire as in (59) or to a chunk
of a tree (a block) that is ready to be split into stove-sized pieces as in (60).

The suffix =enap ‘ground’ refers to a plot in a garden or the things
planted there.
3.3 Classifying items of material culture

Lexical suffixes are used on numerals to refer to four key items of material culture: =e:nixw ‘house’, =wot ‘canoe’, =el:was ‘paddle’, and =el:wat ‘garment’. Other items of material culture may be classified according to shape or function, as discussed in sections 3.4 and 3.5 below.

'The three new houses are very close together.'

(65) xəθəni=ewtxʷ tiʔə telə=ewtxʷ.
four=house DT bank
'There are four banks.'

(66) ʔəwə nəc=ewtxʷ ʔəʔə xʷimelə niʔ ʔə-xə sʔəmənəʔ.
just one=house just store AUX OBL-DT Somenos
'There is just one store at Somenos.'

The suffix =wəl (~xʷəl) 'canoe' refers to canoes and boats of all kinds, including sailboats, warships, and ferries.18

(67) xəθəni=wo:l sənax=əl ?i təcəl.
four=canoe canoe AUX arrive
'Four canoes arrived here.'

(68) xəθə kʷs tliʔ=əwəl-s kʷ qəʔənəl
say.IMP DT three=canoe-3POS DT war.canoe
?i yəʔənə.
AUX PR.come.IMP
'He says there are three war canoes coming.'

---

17 An alternative form =eləxʷ 'house' can be used as a compound lexical suffix to refer to spouses living together under one roof.

(i) xʷ-ᵲ=eləxʷ kʷʔəʔə swəʔəqə?
PR-two=house DT man
'That man has three wives.'

For a man to take on two wives was not unusual in pre-contact times, and sometimes he would take three or four. A woman with two husbands was much rarer.
18 See Hinkson (2001) for a Pan-Salish discussion of the semantics of this suffix.
The general word for canoe *snəxʷəl* today also means 'car', and various canoe terminology has been transferred over to automobile culture.

(69) *kwín=*əwəl  *snəxʷəl*  niʔ  *ʔələxʷ*  niʔ  ?ə kʷθələłamʔ
how many=canoe AUX canoe AUX OBL DT:2POS house
'How many cars were parked in front of your house?'

(70) *ʔələxʷ*=əwəl  ʔə kʷθə  sʔələləxʷ*  neʔm  ʔəməšəəm.
PF-three=canoe.IMP EVID DT elder.PL go tour.IMP
'The elders that are going on a tour are going on three cars.'

This suffix is also used when counting other vehicles, including wagons, buggies, planes, trains, trailers, scooters, bicycles, and skateboards.

(71) *ʔəpən=*əwəl  kʷθə  ʔiʔuʔt.
ten=canoe DT railroad
'The train has ten cars.'

Finally, we see that *=əwəl* is used for counting plates and platters.

(72) *ʔəhí-stəxʷ*  ʔəhín=*əwəl*  ləʔələʔən  ?iʔ  ʔəm=*əxʷəl*
come-CS:3OBJ four=canoe plate.PL and two=canoe platter
'Bring four plates and two platters!'

Pre-contact Salish dishes were long canoe-shaped wooden vessels used for holding food for a group of people. Plates and platters are the only household implements counted in this fashion. Other vessel-like objects are classified as containers, as discussed in section 3.5 below.

The suffix *=əwəs* is used for counting paddles, as in:

(73) *txʷ=*əwəs  kʷθə  na  sʔəməl.
three=paddle DT 1POS paddle
'I have three paddles.'

The most common use of the canoe in modern times is racing. Teams travel throughout the Pacific Northwest to compete in races sponsored by different tribes and bands. Galloway (1993:192) reports that in the Upriver dialect, the suffix *=əwəs* not only counts paddles but also the number of paddlers in a canoe. We have not been able to verify this use in the Island dialect; however, paddlers seem to be counted with the people suffix *=ələ*.
(74) 1xʷ=ələ kʷə klootchman.
three=people the women
'There are three women paddlers.'

The Chinook Jargon word *klootchman* 'woman' is used to refer to women paddlers.

Items of clothing, such as shirts, skirts, dresses, coats, and pajamas, can be counted with the suffix *=əlwa*=t 'garment'.

(75) 1ixʷ=əlwa=tə=nə əkpiwəh.
three=garment DT IPOS shirt
'I have three shirts.'

(76) kəθən=əlwa=tə=nə kəpu.
four=garment DT IPOS coat
'I have four coats.'

Blankets or pieces of cloth that are worn as ceremonial garments can also be counted with *=əlwa*=t.

(77) kʷən=əlwa=tə=nə ləkʷətən?
how.many=garment DT:2POS blanket
'How many blankets do you have?'

(78) 1ixʷ=əlwa=tə=nə səl.
three=garment DT IPOS cloth
'I have three pieces of cloth.'

Other items of material culture do not have lexical suffixes of their own but rather are classified by shape or function, as discussed in the next two sections.

3.4 Classifying by shape

Several lexical suffixes are used with numerals to count objects classified by their shape.

Table 6 Some classifiers for round objects.
The first five suffixes listed in Table 5 refer to round objects of various sorts. Of these suffixes, =as classifies flat round objects. Its most common use is in reference to dollars, originally coins. In modern usage it refers to paper currency as well.

(79) χʷəm ?ə č ʔiʔ ʔɑχim-θ ?ə kʷs ʔəpan=əs? can Q 2SUB CON lend-TR:1OBJ OBL DT ten=round 'Can you lend me ten dollars?'

(80) ɬqecatšə=əs ɬə yaθ ?əw kʷeŋ-ɲəxʷ=əs fifty=round DT always CON get-LCTR:3OBJ-ERG ?ə tə=əw məkʷ ɬqəlč. OBL DT-CON all month 'He receives fifty dollars every month.'

(81) ɕkʷas=əs ʔiʔ kʷ ɬqacs=əs ?ə təʔən teʔə? twenty=round and DT five=round Q DT:2POS money 'Do you have twenty-five dollars?'

Another common use of =as is to count months (i.e. 'moons').

(82) wəwə? niʔ yəsəl=əs ɬqɛlč ʔiʔ ɬeʔ? wəʔ neʔ cam. perhaps AUX two=round moon and again already go go.up. 'It was maybe two months later and he again went up into the mountains.'

(83) ni-i-is ʔkʷin=əs ɬqɛlč kʷas AUX-3SSUB how.many=round month DET:3SSUB swəʔ-təm ʔəsənəl swiʔlas. look.for-TR:PASS.IMP DT young.man 'It was not known how many months they looked for the young man...'

The second suffix in Table 5 is =alas 'loop'. It refers to (rows of) stitches of knitting, meshes of net, and campfires.19

(84) txʷ-yəsəl=alas-staxʷ č təʔən syəʔs ʔiʔ ʔəʔy. only-two=loop-CS:3OBJ 2SUB DT:2POS work and good 'It will be better if you do two more rounds in your knitting.'

(85) ɬaʔin=ələs tə ɬaʔyəʔ four=loop DT fire 'four fires'

---

19 People sit around a campfire in a ring.
Halkomelem women are famous weavers and knitters. Coast Salish style sweaters (often referred to as Cowichan sweaters), vests, toques, and slippers are marketed world-wide. Many natives are commercial fishermen and are adept at gill netting. Suttles (in preparation) states that =alas refers to tens of mesh, as would be used in giving the length of a gill net, the length being given in fathoms. Speakers that we have worked with also use =alas to count single mesh when mending nets.

The loop shape when extended into three-dimensions yields a tube or cylinder figure. The Halkomelem suffix =alas gets used with cylindrical-shaped objects, including pens and sticks.

(86) yəə =alas təə n̓ə̓lən.  
two=loop DT:2POS pen  
'You have two pens.'

(87) ləə =alas səčəxt  
three=loop stick  
'three sticks'

The long three-dimensional shape need not be round. Thus, boards (such as 2" x 4" lumber) can also be referred to by =alas.

(88) kəən =alas təə lałəs?  
how many=loop DT board  
'How many boards are there?'

A third suffix referring to round shapes is =iyəs.\(^{20}\) Like the previous suffix, it seems to refer to loops, including rings, bracelets, and coils of rope.

(89) liə =iyəs nə nə səlaməas.  
three=coil DT 1POS ring  
'I have three rings.'

Whereas the previous suffix =alas extends to oblong objects, =iyəs refers to loop-shaped objects elongated in height. For example, =iyəs is used for coiled baskets and sheaves of wheat that are wrapped with string and then stood vertically in the field.

The fourth suffix in Table 5, =als, is used for small spherical objects, including stones, balls, eggs, berries, fruits, and vegetables.

\(^{20}\) The suffixes =alas and =iyəs derive from the suffix =as plus the connectors =al and =i′ respectively. Until we know more about the form and function of connectors, we have opted to keep these suffixes distinct.
(90) ąaʔ-t ę tə yəsəl=als ıʔəsəl=əxals!
add-TR 2SUB DT two=sphere egg
‘Add two eggs!’

(91) əθəi=nəls kʷθə sqewθə.
four=sphere DT potato
‘There are four potatoes.’

(92) ıxʷ=als tə nə ʔalanəs.
three=sphere DT lPOS orange
‘I have three oranges.’

The suffix =aʔqʷ ‘head’, as noted in section 3.1, is used to count fish, fish heads, and sea-life. It is also used to count vegetables that grow in ‘heads’, such as lettuce, cabbage, and garlic. Balls of yarn and berries can be counted either with this suffix or with the suffix =als. We surmise that historically the difference between the two suffixes may have been size, where =aʔqʷ referred to larger spherical objects and =als referred to smaller spherical objects. Future research may shed light on this issue.

The last two suffixes in Table 5 refer to long thin objects; see Table 7 below. The lexical suffix =eməl⁰ refers to rigid objects such as poles, rods, logs, boards, sticks, house posts, roads, and water pipes.²¹

(93) əθən=eməl⁰ kʷθə qeqən.
four=long DT house.post
‘There are four house posts.’

(94) ıxʷ=eməl⁰ qʷleʔ
three=long log
‘three logs’

(95) əθən=eməl⁰ šəl
four=long road
‘four roads’

Not all rigid objects with a long thin shape are counted with this suffix. For example, trees are counted with =ol p, paddles with =ol wəs, and pencils (since they are perceived as cylinders) with =aləs, while brooms are counted without a suffix on the numeral.

²¹ Galloway (1993:193) gives the suffix =eməc (prob. =eməlo) ‘upright, poles’. We have found in Island dialect that the suffix applies to horizontal as well as vertical objects.

Table 7 Suffixes referring to long, thin, rigid objects and flexible objects.

In contrast, =i³⁶e⁹ refers to long, thin, flexible objects like cedar roots, ropes, strands of yarn, or strips of cloth or bark.

(95) k*³⁹o lœces=³³⁹e⁹ k*³al³x⁹
  DT five=strand dog,salmon
  'five strips of dog salmon.'

(96) ?³⁹a?k*⁵=³³⁹e⁹ l³⁹e⁹ n³ x*i¹³l³m.
  seven=strand DT IPOS thread
  'I had seven pieces of thread.'

In sum, Halkomelem has a large set of lexical suffixes that classify objects according to features of shape. The semantic parameters used in the Halkomelem system match the results of cross-linguistic research on classifiers by Allan (1977), and Denny (1979), among others. The key parameters are dimension (e.g. flat vs. spherical) and consistency (rigid vs. flexible). Also Halkomelem uses secondary features involving size and elongation. The Halkomelem system allows for the accommodation of new items, which are
added to the system according to their shapes or shared function with a core classified object.

3.5 Classifying containers and groups

Three classifiers refer to objects that are put together into some arrangement and the containers that hold them.

Table 8 Suffixes referring to containers and piled up objects.
The lexical suffix =aqən is used to count items of material culture whose function involves containment of a substance, e.g. bowls, cups, teapots, pans, pots, pipes, and lanterns.

(98) nača?=aqən qəl' tən sqʷəls.
    one=container just DT:2POS pot
    'You have just one pot.'

(99) lixʷ=qən ḡə nə ǎstihələ.
    three=container DT 1POS teapot
    'I have three teapots.'

(100) kʷín=aqən ḡəm kʷə ni? ˈiłəŋ-ət-əxʷ.
    how many=container box DT AUX buy-TR-2SSUB
    'How many boxes did you buy?'

The suffix =aqən is also used to count containers of all sizes, including buckets, barrels, baskets, jars, cans, boxes, sacks, suitcases, and pillowcases. The noun associated with the numeral phrase can be the container (101-102) or the substance contained (103-104).

(101) kʷín=aqən kʷən skʷəwəs.
    how many=container DT:2POS bucket
    'How many buckets do you have?'

(102) ném teš ḡə nač=aqən lišə
    one=round money DT one=container sack
    'one dollar a sack'

(103) ném kʷən-ət ˈtecs=aqən sqəwə.
    go take-TR five=container potato
    'Go get five sacks of potatoes!'

(104) ném kən ˈləwen-ə tə nə maŋə
    go 1SUB give.gifts-TR DT 1POS offspring
    [ʔə kəθə ʔapən=aqən ʔapəls].
    OBL DT ten=container apple
    'I am going to bring gifts (of 10 boxes of apples) for my daughter.'

The suffix =əle⁷c is used to refer to a collection of items that constitute a load and to the packaging method that effects this. This includes bales of hay, bundles of wood, barrels of fish, baskets of laundry, bundles of blankets, sacks of potatoes, boxes of fruit, and trunks of possessions.
(105) \( lx^=\aleph^c \quad sqew\theta \)
three=bundle potato
‘three packages of potatoes’

(106) \( n\aleph=\aleph^c \quad \theta \alpha \quad n\alpha \quad sit\alpha \)
one=bundle DT 1POS basket
‘one basketful’

Large containers, since they often constitute a load, can be classified with either
\( =\aleph^c \) or \( =aq\alpha \). If the emphasis is on the amount of the item then \( =\aleph^c \) is
used. If the emphasis is on the type of container the item is in, then \( =aq\alpha \) is
used.

(107) \( k^*in=\aleph^c \quad \theta \alpha \eta \quad i\alpha m\alpha w\lambda \epsilon ? \)
how many=bundle DT:2POS barrel
‘How many (loads of) barrels?’

(108) \( k^*in=aq\alpha \quad \theta \alpha \eta \quad i\alpha m\alpha w\lambda \epsilon ? \)
how many=container DT:2POS barrel
‘How many barrels?’

It is also possible to use the suffix \( =\aleph c \) to refer to a quantity of an item that
constitutes a load even if the item is not contained.

(109) \( k^*in=\alpha l\alpha ^c \quad \theta \alpha \eta \quad l\alpha x^*t\alpha n? \)
how many=bundle DT:2POS blanket
‘How many stacks of blankets do you have?’\(^{22}\)

(110) \( lx^*=\aleph^c \quad x^*il\alpha m \)
three=bundle rope
‘three coils of rope’

The lexical suffix \( =map \) is the most difficult of the classifier suffixes to
gloss. Suttles (in preparation) defines this suffix as ‘kind, part, piece’ while
Galloway (1993:214) defines it as ‘piles’.\(^{23}\) We see reflections of the first

\(^{22}\) We were told that that a bundle of ten blankets make a stack.

\(^{23}\) The suffix \( =\omega\theta \) also means ‘kind’. It appears to modify any inanimate noun that has
a variety of types, e.g. spears, berries, stories, languages, medicines, canoes, and spears.

(i) \( x^*x\alpha\theta in=\omega\omega \theta \quad snax^*\omega l \)
PR-four=kind canoe
‘four kinds of canoes’
meaning in examples in (110-113), where the suffix means 'part', 'piece', or 'group.'

(111) niʔ can xʷə-łxʷ=əmat-stəxʷ kʷə-nə-s hič-ət
AUX ISUB become-three=part-CS:3OBJ DT-IPOS-NM cut-TR
təʔ qəʔiʔ.
DT sockeye
'I sliced the sockeye (salmon) into three chunks.'

two=part FUT DT go leave-CS:3OBJ-1PL:SSUB
(112) yəsal=əmat ceʔ kʷə nəm həyeʔ-stəxʷ-ət.
'we are going to take two teams.'

(113) 'ile xʷəlməxʷ=qən ta nəčə=mat pukʷ
let's Indian=throat DT one=part book
'Let's Speak our First Nations Language: Book 1'
(title of a Halkomelem textbook)

(114) liixʷ=əmat sčəlaʔ
three=part leaf
'three piles of leaves'

(115) liixʷ=əmat xʷiłəm
three=part rope
'three piles of rope'

Blankets, mats, and rugs of all kinds are also counted with =mat.

(116) txʷ-łxʷ=əmat ?əl əə nə swəʔəʔəl.
just-three=part only DT IPOS goat.blanket
'I only have three goat wool blankets.'

(117) xəʔən=əmat sləwən
four=part bulrush.mat
'four bulrush mats'

(ii) xʷ-łxʷ=aʔəθ təʔ sqʷəl.
PR-three=kind DT speech
'There are three different ways of speaking.'

It was unclear to us whether this should be regarded as a classifier or a compounding use of a suffix.
Traditionally, the dog wool and goat wool blankets were used for ceremonial purposes in the longhouse. The blankets were laid down on top of each other in a pile. The suffix =mat now applies to blankets even when they are not piled.

As Aikhenvald (2000:115) notes: “Since the choice of a mensural classifier is often determined by the temporary state of an object (its quantity, or the arrangement it occurs in) there may be more freedom in choosing a mensural classifier than in choosing a sortal one.” This is exactly what we find in Halkomelem. Choosing between the classifiers =sqan, =e?ac, and =mat varies from situation to situation, depending on whether emphasis is being placed on the quantity, the arrangement, or the containment of the item. Also relevant is whether the item will be stored, carried, or used in that configuration.

3.6 Summary: the Halkomelem system

This section has discussed the form and function of lexical suffixes used as numeral classifiers in Halkomelem. The system includes both sortal and mensural classifiers. Sortal classifiers refer to a specific kind of entity or to a shape-based class of entities. A handful of specific suffixes refer to living things—flora, fauna, and people, but the majority of suffixes refer to inanimate objects. Some specific suffixes refer to key items of the natural environment and the material culture. The specific suffixes allow us to draw a picture of the most important items in the Halkomelem pre-contact lifestyle—people, waterfowl, fish, trees, plants, ground, firewood, houses, canoes, paddles, and garments. Most inanimate objects are classified based on their shape. Small round flat objects, loops, coils, spheres, long thin rigid objects, and long thin flexible objects seem to be the main classificatory categories for objects. Some suffixes extend in length or height and thus include cylindrical objects. The mensural classifiers allow for several perspectives on a item based on its containment, its packability, its arrangement into piles or stacks, or its division into parts.

The Halkomelem system easily accommodates new items. They fit into the system based upon their shape or manner of containment. In addition, classifiers can extend semantically based on shared functions. For example, the suffix for small round flat objects, used first for coins, subsequently extended to paper money.

It may be the case that in earlier times all items were obligatorily classified. But today many nouns are counted without the use of lexical suffixes. These include mountains, bays, lakes, rivers, islands, points of land, and other large land forms. Hours, days, and weeks are not classified. In addition many of the larger items of material culture—tables, chairs, doors, desks, axes, brooms—are not classified. More abstract items, such as stories, words, languages, and work, are not classified, even though they are counted.

(118) n̓it n̓aʔə? syays-ʔ t̓ə swaʔləs t̓ə syəʔ.
3EMPH one work-3POS DT boy.PL DT firewood
'The wood was one of the jobs for the boys.'
So a likely hypothesis is that only the most important and smaller items (ones that were handled, probably) were obligatorily counted with classifiers.

4 Conclusion

This paper explored the system of numeral classification in Halkomelem. Some countable concrete nouns are counted with simple cardinal numbers, but many nouns can be counted with classificatory lexical suffixes. We discuss both the meaning of the suffixes and the nouns that they classify. Classifiers refer to animate and inanimate entities. Suffixes for animates characterize the most salient feature of the entity. Some classifiers for inanimates originate in suffixes referring to specific elements of the natural environment or items of material culture. Most inanimates, however, are classified according to their shape or function. In sum, classification in Halkomelem is the sort of system that we are led to expect based on cross-linguistic typological research. (See Aikhenvald 2000 and references therein.)
