

# STAT 330

# Tutorial 1

Mengqi (Molly) Cen  
Department of Statistics & Actuarial Science

Sept 14<sup>th</sup> / Sept 16<sup>th</sup>

# Textbook

Introduction of  
Mathematical  
Statistics, 8<sup>th</sup> Edition

# Assignments

- 1<sup>st</sup> assignment is assigned by emailing to the class list and posting in the course's canvas and web pages.
- Due on Sept 23<sup>rd</sup> by 17:30
- Submit Hwk by **CANVAS!**

# Contents

- R & Rstudio
- R Examples
- Proof Strategy
- Review of Set Theory

# R Examples

See `example.r`

# Proof Strategy

- Direct Proof
- Proof by Contradiction
- Proof by Induction
- Proof by Contrapositive

# Proof Strategy

Example:

The sum of any two consecutive numbers is odd.

# Proof Strategy

## Direct Proof

Assume  $P$  true  
Use  $P$  to show that  $Q$  true

# Proof Strategy

## Direct Proof

Assume  $a, b$  are consecutive integers

so  $b = a + 1$

$$a + b = a + (a + 1) = 2a + 1$$

since  $a$  is an integer,

$2a$  is an even number

$2a + 1$  is an odd number

# Proof Strategy

## Proof by Contradiction

Assume  $P, \neg Q$  true  
But deriving a contradiction

# Proof Strategy

## Proof by Contradiction

Assume  $a, b$  are consecutive integers

Also assume  $a+b$  is **not** odd

Then no integer  $k$  such that  $(a+b) = 2k+1$

But  $a+b = a+(a+1) = 2a+1$

There is a contradiction

So  $a+b$  is odd

# Proof Strategy

## Proof by Induction

Base case: Proof  $P, Q$  true for some basis case

Induction: Proof if  $P, Q$  is true for  $n$ , then they  
are true for  $n+1$

# Proof Strategy

## Proof by Induction

Base case:  $1+2 = 3$  is odd

Induction case:

If  $x+(x+1)$  is odd

Then  $x+(x+1)+2$  is also odd

$$x+(x+1)+2 = x+1+(x+1+1)$$

we can proof that if the statement is true for some  $x$  and its successor, then it is true for  $x+1$  and its successor

# Proof Strategy

## Proof by Contrapositive

Proof  $\neg Q \rightarrow \neg P$

# Proof Strategy

## Proof by Contrapositive

If  $(a+b)$  is not odd, then  $a$  and  $b$  are not consecutive integers

since  $(a+b)$  is not odd, there is no  $k$  exists such that  $a+b = 2k+1$

so  $(a+b) = k+(k+1)$  does not hold for any integer  $k$ .

But  $k+1$  is the successor of  $k$ , which implies that  $a$  and  $b$  cannot be consecutive

# Review of Set Theory

## Complement

**Definition 1.2.1.** *The complement of an event  $A$  is the set of all elements in  $C$  which are not in  $A$ . We denote the complement of  $A$  by  $A^c$ . That is,  $A^c = \{x \in C : x \notin A\}$ .*

$$C^c = \phi \text{ and } \phi^c = C$$

# Review of Set Theory

## Subset

**Definition 1.2.2.** *If each element of a set  $A$  is also an element of set  $B$ , the set  $A$  is called a **subset** of the set  $B$ . This is indicated by writing  $A \subset B$ . If  $A \subset B$  and also  $B \subset A$ , the two sets have the same elements, and this is indicated by writing  $A = B$ .*

# Review of Set Theory

## Union

**Definition 1.2.3.** *Let  $A$  and  $B$  be events. Then the **union** of  $A$  and  $B$  is the set of all elements that are in  $A$  or in  $B$  or in both  $A$  and  $B$ . The union of  $A$  and  $B$  is denoted by  $A \cup B$*

# Review of Set Theory

## Intersection

**Definition 1.2.4.** *Let  $A$  and  $B$  be events. Then the **intersection** of  $A$  and  $B$  is the set of all elements that are in both  $A$  and  $B$ . The intersection of  $A$  and  $B$  is denoted by  $A \cap B$*

# Review of Set Theory

## Disjoint

**Definition 1.2.5.** *Let  $A$  and  $B$  be events. Then  $A$  and  $B$  are **disjoint** if  $A \cap B = \phi$*

Thanks!
