Distribution Theory

Basic Problem:

Start with assumptions about f or CDF of random vector $X = (X_1, \dots, X_p)$.

Define $Y = g(X_1, ..., X_p)$ to be some function of X (usually some statistic of interest).

Compute distribution or CDF or density of Y?

Univariate Techniques

Method 1: compute the CDF by integration and differentiate to find f_Y .

Example: $U \sim \text{Uniform}[0,1]$ and $Y = -\log U$.

$$F_Y(y) = P(Y \le y) = P(-\log U \le y)$$

= $P(\log U \ge -y) = P(U \ge e^{-y})$
= $\begin{cases} 1 - e^{-y} & y > 0 \\ 0 & y \le 0 \end{cases}$

so Y has standard exponential distribution.

Example: $Z \sim N(0,1)$, i.e.

$$f_Z(z) = \frac{1}{\sqrt{2\pi}}e^{-z^2/2}$$

and $Y = Z^2$. Then

$$F_Y(y) = P(Z^2 \le y)$$

$$= \begin{cases} 0 & y < 0 \\ P(-\sqrt{y} \le Z \le \sqrt{y}) & y \ge 0. \end{cases}$$

Now differentiate

$$P(-\sqrt{y} \le Z \le \sqrt{y}) = F_Z(\sqrt{y}) - F_Z(-\sqrt{y})$$

to get

$$f_Y(y) = \begin{cases} 0 & y < 0 \\ \frac{d}{dy} \left[F_Z(\sqrt{y}) - F_Z(-\sqrt{y}) \right] & y > 0 \\ \text{undefined} & y = 0 \,. \end{cases}$$

Then

$$\frac{d}{dy}F_Z(\sqrt{y}) = f_Z(\sqrt{y})\frac{d}{dy}\sqrt{y}$$

$$= \frac{1}{\sqrt{2\pi}}\exp\left(-(\sqrt{y})^2/2\right)\frac{1}{2}y^{-1/2}$$

$$= \frac{1}{2\sqrt{2\pi y}}e^{-y/2}.$$

(Similar formula for other derivative.) Thus

$$f_Y(y) = \begin{cases} \frac{1}{\sqrt{2\pi y}} e^{-y/2} & y > 0\\ 0 & y < 0\\ \text{undefined} & y = 0 \end{cases}$$

We will find indicator notation useful:

$$1(y>0) = \begin{cases} 1 & y>0\\ 0 & y \le 0 \end{cases}$$

which we use to write

$$f_Y(y) = \frac{1}{\sqrt{2\pi y}}e^{-y/2}1(y>0)$$

(changing definition unimportantly at y = 0).

Notice: I never evaluated F_Y before differentiating it. In fact F_Y and F_Z are integrals I can't do but I can differentiate them anyway. Remember fundamental theorem of calculus:

$$\frac{d}{dx} \int_{a}^{x} f(y) \, dy = f(x)$$

at any x where f is continuous.

Summary: for Y=g(X) with X and Y each real valued

$$P(Y \le y) = P(g(X) \le y)$$

= $P(X \in g^{-1}(-\infty, y])$.

Take d/dy to compute the density

$$f_Y(y) = \frac{d}{dy} \int_{\{x: g(x) \le y\}} f_X(x) dx.$$

Often can differentiate without doing integral.

Method 2: Change of variables.

Assume g is one to one. I do: g is increasing and differentiable. Interpretation of density (based on density = F'):

$$f_Y(y) = \lim_{\delta y \to 0} \frac{P(y \le Y \le y + \delta y)}{\delta y}$$
$$= \lim_{\delta y \to 0} \frac{F_Y(y + \delta y) - F_Y(y)}{\delta y}$$

and

$$f_X(x) = \lim_{\delta x \to 0} \frac{P(x \le X \le x + \delta x)}{\delta x}$$
.

Assume y = g(x). Define δy by $y + \delta y = g(x + \delta x)$. Then

$$P(y \le Y \le y + \delta y) = P(x \le X \le x + \delta x).$$

Get

$$\frac{P(y \le Y \le y + \delta y)}{\delta y} = \frac{P(x \le X \le x + \delta x)/\delta x}{\{g(x + \delta x) - y\}/\delta x}.$$

Take limit to get

$$f_Y(y) = f_X(x)/g'(x)$$

or

$$f_Y(g(x))g'(x) = f_X(x).$$

Alternative view:

Each probability is integral of a density:

First is integral of f_Y over the small interval from y = g(x) to $y = g(x + \delta x)$. The interval is narrow so f_Y is nearly constant and

$$P(y \le Y \le g(x+\delta x)) \approx f_Y(y)(g(x+\delta x)-g(x))$$
.

Since g has a derivative the difference

$$g(x + \delta x) - g(x) \approx \delta x g'(x)$$

and we get

$$P(y \le Y \le g(x + \delta x)) \approx f_Y(y)g'(x)\delta x$$
.

Same idea applied to $P(x \le X \le x + \delta x)$ gives

$$P(x \le X \le x + \delta x) \approx f_X(x)\delta x$$

so that

$$f_Y(y)g'(x)\delta x \approx f_X(x)\delta x$$

or, cancelling the δx in the limit

$$f_Y(y)g'(x) = f_X(x).$$

If you remember y = g(x) then you get

$$f_X(x) = f_Y(g(x))g'(x).$$

Or solve y = g(x) to get x in terms of y, that is, $x = g^{-1}(y)$ and then

$$f_Y(y) = f_X(g^{-1}(y))/g'(g^{-1}(y))$$

This is just the change of variables formula for doing integrals.

Remark: For g decreasing g' < 0 but then the interval $(g(x), g(x + \delta x))$ is really $(g(x + \delta x), g(x))$ so that $g(x) - g(x + \delta x) \approx -g'(x)\delta x$. In both cases this amounts to the formula

$$f_X(x) = f_Y(g(x))|g'(x)|.$$

Mnemonic:

$$f_Y(y)dy = f_X(x)dx$$
.

Example: $X \sim \text{Weibull}(\text{shape } \alpha, \text{ scale } \beta)$ or

$$f_X(x) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha - 1} \exp\left\{-(x/\beta)^{\alpha}\right\} \mathbf{1}(x > 0).$$

Let $Y = \log X$ or $g(x) = \log(x)$.

Solve $y = \log x$: $x = \exp(y)$ or $g^{-1}(y) = e^y$.

Then g'(x) = 1/x and

$$1/g'(g^{-1}(y)) = 1/(1/e^y) = e^y$$
.

Hence

$$f_Y(y) = \frac{\alpha}{\beta} \left(\frac{e^y}{\beta}\right)^{\alpha - 1} \exp\left\{-\left(\frac{e^y}{\beta}\right)^{\alpha}\right\} \mathbf{1}(e^y > 0)e^y.$$

For any y, $e^y > 0$ so indicator = 1. So

$$f_Y(y) = \frac{\alpha}{\beta^{\alpha}} \exp \left\{ \alpha y - e^{\alpha y} / \beta^{\alpha} \right\} .$$

Define $\phi = \log \beta$ and $\theta = 1/\alpha$; then,

$$f_Y(y) = \frac{1}{\theta} \exp\left\{\frac{y-\phi}{\theta} - \exp\left\{\frac{y-\phi}{\theta}\right\}\right\}.$$

Extreme Value density with **location** parameter ϕ and **scale** parameter θ . (Note: several distributions are called Extreme Value.)

Marginalization

Simplest multivariate problem:

$$X = (X_1, \dots, X_p), \qquad Y = X_1$$

(or in general Y is any X_j).

Theorem 1 If X has density $f(x_1, ..., x_p)$ and q < p then $Y = (X_1, ..., X_q)$ has density

$$f_Y(x_1, \dots, x_q) = \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} f(x_1, \dots, x_p) dx_{q+1} \dots dx_p$$

 $f_{X_1,...,X_q}$ is the **marginal** density of $X_1,...,X_q$ and f_X the **joint** density of X but they are both just densities. "Marginal" just to distinguish from the joint density of X.

Example: The function

 $f(x_1, x_2) = Kx_1x_2\mathbf{1}(x_1 > 0, x_2 > 0, x_1 + x_2 < 1)$ is a density provided

$$P(X \in \mathbb{R}^2) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x_1, x_2) \, dx_1 \, dx_2 = 1.$$

The integral is

$$K \int_0^1 \int_0^{1-x_1} x_1 x_2 dx_2 dx_1$$

$$= K \int_0^1 x_1 (1-x_1)^2 dx_1/2$$

$$= K(1/2 - 2/3 + 1/4)/2$$

$$= K/24$$

so K=24. The marginal density of x_1 is

$$f_{X_1}(x_1) = \int_{-\infty}^{\infty} 24x_1 x_2$$

$$\times 1(x_1 > 0, x_2 > 0, x_1 + x_2 < 1) dx_2$$

$$= 24 \int_{0}^{1-x_1} x_1 x_2 1(0 < x_1 < 1) dx_2$$

$$= 12x_1(1 - x_1)^2 1(0 < x_1 < 1).$$

This is a Beta(2,3) density.

General case: $Y = (Y_1, ..., Y_q)$ with components $Y_i = g_i(X_1, ..., X_p)$.

Case 1: q > p.

Y won't have density for "smooth" g.

Y will have a **singular** or discrete distribution. Problem rarely of real interest.

But, e.g., residuals in regression problems have singular distribution.

Case 2: q = p.

Use change of variables formula which generalizes the one derived above for the case p=q=1. (See below.)

Case 3: q < p.

Pad out Y: add on p-q more variables (carefully chosen) say Y_{q+1}, \ldots, Y_p .

Find functions g_{q+1}, \ldots, g_p . Define for $q < i \le p$, $Y_i = g_i(X_1, \ldots, X_p)$ and $Z = (Y_1, \ldots, Y_p)$.

Choose g_i so that we can use change of variables on $g = (g_1, \ldots, g_p)$ to compute f_Z .

Find f_Y by integration:

$$f_Y(y_1,...,y_q) = \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} f_Z(y_1,...,y_q,z_{q+1},...,z_p) dz_{q+1}...dz_p$$

Change of Variables

Suppose $Y = g(X) \in R^p$ with $X \in R^p$ having density f_X . Assume g is a one to one ("injective") map, i.e., $g(x_1) = g(x_2)$ if and only if $x_1 = x_2$. Find f_Y :

Step 1: Solve for x in terms of y: $x = g^{-1}(y)$.

Step 2: Use basic equation:

$$f_Y(y)dy = f_X(x)dx$$

and rewrite it in the form

$$f_Y(y) = f_X(g^{-1}(y)) \frac{dx}{dy}$$

Interpretation of derivative $\frac{dx}{dy}$ when p > 1:

$$\frac{dx}{dy} = \left| \det \left(\frac{\partial x_i}{\partial y_j} \right) \right|$$

which is the so called Jacobian.

Equivalent formula inverts the matrix:

$$f_Y(y) = \frac{f_X(g^{-1}(y))}{\left|\frac{dy}{dx}\right|}.$$

This notation means

$$\left| \frac{dy}{dx} \right| = \left| \det \left[\begin{array}{ccc} \frac{\partial y_1}{\partial x_1} & \frac{\partial y_1}{\partial x_2} & \cdots & \frac{\partial y_1}{\partial x_p} \\ \vdots & & & \\ \frac{\partial y_p}{\partial x_1} & \frac{\partial y_p}{\partial x_2} & \cdots & \frac{\partial y_p}{\partial x_p} \end{array} \right] \right|$$

but with x replaced by the corresponding value of y, that is, replace x by $g^{-1}(y)$.

Example: The density

$$f_X(x_1, x_2) = \frac{1}{2\pi} \exp\left\{-\frac{x_1^2 + x_2^2}{2}\right\}$$

is the **standard bivariate normal density**. Let $Y=(Y_1,Y_2)$ where $Y_1=\sqrt{X_1^2+X_2^2}$ and $0 \le Y_2 < 2\pi$ is angle from the positive x axis to the ray from the origin to the point (X_1,X_2) . I.e., Y is X in polar co-ordinates.

Solve for x in terms of y:

$$X_1 = Y_1 \cos(Y_2)$$

$$X_2 = Y_1 \sin(Y_2)$$

so that

$$g(x_1, x_2) = (g_1(x_1, x_2), g_2(x_1, x_2))$$

$$= (\sqrt{x_1^2 + x_2^2}, \operatorname{argument}(x_1, x_2))$$

$$g^{-1}(y_1, y_2) = (g_1^{-1}(y_1, y_2), g_2^{-1}(y_1, y_2))$$

$$= (y_1 \cos(y_2), y_1 \sin(y_2))$$

$$\left| \frac{dx}{dy} \right| = \left| \det \begin{pmatrix} \cos(y_2) & -y_1 \sin(y_2) \\ \sin(y_2) & y_1 \cos(y_2) \end{pmatrix} \right|$$

$$= y_1.$$

It follows that

$$f_Y(y_1, y_2) = \frac{1}{2\pi} \exp\left\{-\frac{y_1^2}{2}\right\} y_1 \times 1(0 \le y_1 < \infty) 1(0 \le y_2 < 2\pi).$$

Next: marginal densities of Y_1 , Y_2 ?

Factor f_Y as $f_Y(y_1, y_2) = h_1(y_1)h_2(y_2)$ where

$$h_1(y_1) = y_1 e^{-y_1^2/2} 1(0 \le y_1 < \infty)$$

and

$$h_2(y_2) = 1(0 \le y_2 < 2\pi)/(2\pi)$$
.

Then

$$f_{Y_1}(y_1) = \int_{-\infty}^{\infty} h_1(y_1)h_2(y_2) dy_2$$
$$= h_1(y_1) \int_{-\infty}^{\infty} h_2(y_2) dy_2$$

so marginal density of Y_1 is a multiple of h_1 . Multiplier makes $\int f_{Y_1} = 1$ but in this case

$$\int_{-\infty}^{\infty} h_2(y_2) \, dy_2 = \int_{0}^{2\pi} (2\pi)^{-1} dy_2 = 1$$

so that

$$f_{Y_1}(y_1) = y_1 e^{-y_1^2/2} 1(0 \le y_1 < \infty).$$

(Special Weibull or Rayleigh distribution.)

Similarly

$$f_{Y_2}(y_2) = 1(0 \le y_2 < 2\pi)/(2\pi)$$

which is the **Uniform** $(0,2\pi)$ density. Exercise: $W=Y_1^2/2$ has standard exponential distribution. Recall: by definition $U=Y_1^2$ has a χ^2 distribution on 2 degrees of freedom. Exercise: find χ_2^2 density.

Note: We show below factorization of density is equivalent to independence.
