## Assignment \#4

Assignment date: Monday Feb. 2, 2009
Due date: Monday Feb. 9, 2009

## Problem1: (Nozzle)

The converging-diverging nozzle shown in Fig. 1 expands and accelerates dry air to supersonic speeds at the exit, where $p_{2}=8 \mathrm{kPa}$ and $T_{2}=240 \mathrm{~K}$. At the throat, $p_{1}=284 \mathrm{kPa}, T_{1}=665 \mathrm{~K}$, and $\quad V_{1}=517 \mathrm{~m} / \mathrm{s}$. For steady compressible flow of an ideal gas, estimate (a) the mass flow in $\mathrm{kg} / \mathrm{h}$, (b) the velocity $V_{2}$, and (c) the Mach number $M a_{2}$.
 $D_{2}=2.5 \mathrm{~cm}$

## Solution

The mass flow is given by the throat conditions:

$$
\dot{m}=\rho_{1} A_{1} V_{1}
$$

where $A_{1}$ is the cross-sectional area at point 1 . Density of the gas can be obtained from the following equation

$$
\rho=\frac{p}{R T}
$$

where $R=287 \mathrm{~J} / \mathrm{K} . \mathrm{kg}$ for air and $T$ is in Kelvin. Hence, for point 1,

$$
\rho_{1}=\frac{p_{1}}{R T_{1}}=\frac{284000[\mathrm{pa}]}{287\left[\frac{\mathrm{~J}}{\mathrm{~kg} \cdot \mathrm{~K}}\right] \times 665[\mathrm{~K}]}=1.3\left[\frac{\mathrm{~kg}}{\mathrm{~m}^{3}}\right]
$$

and mass flow rate is

$$
\dot{m}_{1}=1.3\left[\frac{\mathrm{~kg}}{\mathrm{~m}^{3}}\right] \times\left(\pi \frac{0.01^{2}}{4}\left[\mathrm{~m}^{2}\right]\right) \times 517\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]=0.0604\left[\frac{\mathrm{~kg}}{\mathrm{~s}}\right]
$$

For steady flow, mass flow rate remains constant, hence,

$$
\dot{m}_{1}=\dot{m}_{2}=\rho_{2} A_{2} V_{2}
$$

therefore

$$
V_{2}=\frac{\dot{m}_{1}}{\rho_{2} A_{2}}=\frac{\dot{m}_{1}}{\frac{p_{2}}{R T_{2}} A_{2}}=\frac{0.0604\left[\frac{\mathrm{~kg}}{\mathrm{~s}}\right]}{\frac{8000[\mathrm{pa}]}{287\left[\frac{\mathrm{~J}}{\mathrm{~kg} \cdot \mathrm{~K}}\right] \times 240[\mathrm{~K}]} \times\left(\pi \frac{0.025^{2}}{4}\left[\mathrm{~m}^{2}\right]\right)}=1060\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]
$$

Recall that the speed of sound of an ideal gas is $a=\sqrt{k R T}$ where $k=c_{p} / c_{v}$ and Mach number is defined as (what is the unit of Mach number?)

$$
M a=\frac{V}{a}
$$

At point 2 the Mach number is

$$
M a_{2}=\frac{V_{2}}{a}=\frac{1060\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]}{\sqrt{1.4 \times 287\left[\frac{\mathrm{~J}}{\mathrm{~kg} \cdot \mathrm{~K}}\right] \times 240[\mathrm{~K}]}}=3.14
$$

Problem 2 (water jet)
A steady two-dimensional water jet, 4 cm thick with a weight flow rate of $1960 \mathrm{~N} / \mathrm{s}$, strikes an angled barrier as in Fig. 2. Pressure and water velocity are constant everywhere. Thirty percent of the jet passes through the slot. The rest splits symmetrically along the barrier. Calculate the horizontal force $F$ needed, per unit thickness into the paper, to hold the barrier stationary.

Figure 2 schematic of water jet

## Solution

For water take $\rho=998 \mathrm{~kg} / \mathrm{m}^{3}$. The control volume (see figure) cuts through all four jets, which are numbered. The velocity of all jets follows from the weight flow at (1)

$$
V_{1}=\frac{\dot{w}}{\rho g A_{1}}=\frac{1960\left[\frac{\mathrm{~N}}{\mathrm{~s}}\right]}{9.81\left[\frac{\mathrm{~m}}{\mathrm{~s}^{2}}\right] \times 998\left[\frac{\mathrm{~kg}}{\mathrm{~m}^{3}}\right] \times 0.04[\mathrm{~m}] \times 1[\mathrm{~m}]}=5\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]
$$

$$
\begin{gathered}
\dot{m}_{1}=\frac{\dot{w}}{g}=\frac{1960\left[\frac{N}{s}\right]}{9.81\left[\frac{\mathrm{~m}}{\mathrm{~s}^{2}}\right]}=200\left[\frac{\mathrm{~kg}}{\mathrm{s.m}}\right] \\
\dot{m}_{2}=0.3 \dot{m}_{1}=60\left[\frac{\mathrm{~kg}}{\mathrm{s.m}}\right] \\
\dot{m}_{3}=\dot{m}_{4}=\frac{\dot{m}_{1}-\dot{m}_{2}}{2}=0.35 \dot{m}_{1}=70\left[\frac{\mathrm{~kg}}{\mathrm{s.m}}\right]
\end{gathered}
$$

Then the x-momentum relation for this control volume yields

$$
\begin{gathered}
\sum F_{x}=-F=\dot{m}_{2} V_{2}+\dot{m}_{3} V_{3}+\dot{m}_{4} V_{4}-\dot{m}_{1} V_{1} \\
-F=60\left[\frac{\mathrm{~kg}}{\mathrm{s.m}}\right] \times 5\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]+70\left[\frac{\mathrm{~kg}}{\mathrm{~s} . \mathrm{m}}\right] \times\left(-5\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right] \times \cos 55^{\circ}\right)+70\left[\frac{\mathrm{~kg}}{\mathrm{~s} . \mathrm{m}}\right] \\
\times\left(-5\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right] \times \cos 55^{\circ}\right)-200\left[\frac{\mathrm{~kg}}{\mathrm{~s} . \mathrm{m}}\right] \times 5\left[\frac{\mathrm{~m}}{\mathrm{~s}}\right]=1100\left[\frac{\mathrm{~N}}{\mathrm{~m}}\right]
\end{gathered}
$$
