$$
(12)(\pi)\left(0.08^{2}\right) / 4=(0.10)(0.3016)+\mathrm{V}_{2}(\pi)\left(0.08^{2}\right) / 4 \quad \mathbf{V}_{2}=\mathbf{6} \mathbf{~ m} / \mathbf{s} \quad \text { Ans. (b) }
$$

(c) Setting the outflow V2 to $9 \mathrm{~m} / \mathrm{s}$, the wall suction velocity is,

$$
(12)(\pi)\left(0.08^{2}\right) / 4=\left(\mathrm{v}_{\mathrm{w}}\right)(0.3016)+(9)(\pi)\left(0.08^{2}\right) / 4 \quad \mathbf{v}_{\mathrm{w}}=\mathbf{0 . 0 5} \mathbf{~ m} / \mathbf{s}=\mathbf{5} \mathbf{~ c m} / \mathbf{s} \text { out }
$$

3.11 A room contains dust at uniform concentration $\mathrm{C}=\rho$ dust $\rho$. It is to be cleaned by introducing fresh air at an inlet section $\mathrm{Ai}, \mathrm{Vi}$ and exhausting the room air through an outlet section. Find an expression for the rate of change of dust mass in the room.

Solution: This problem is very similar to Prob. 3.9 on the previous page, except that here $\mathrm{Ci}=0$ (dustfree air). Refer to the figure in Prob. 3.9. The dust mass relation is

$$
\begin{aligned}
& \left.\frac{\mathrm{dM}_{\text {dust }}}{\mathrm{dt}}\right|_{\text {system }}=0=\frac{\mathrm{d}}{\mathrm{dt}}\left(\int_{\mathrm{CV}} \rho_{\mathrm{dust}} \mathrm{~d} v\right)+\mathrm{C}_{\mathrm{out}} \dot{\mathrm{~m}}_{\mathrm{out}}-\mathrm{C}_{\mathrm{in}} \dot{\mathrm{~m}}_{\mathrm{in}}, \\
& \text { or, since } \mathrm{C}_{\text {in }}=0 \text {, we obtain }\left.\frac{\mathrm{dM}}{\mathrm{dtus}}\right|_{\mathrm{CV}}=-\mathbf{C} \rho \mathbf{A}_{\mathbf{0}} \mathbf{V}_{\mathbf{o}} \quad \text { Ans. }
\end{aligned}
$$

To complete the analysis, we would need to make an overall fluid mass balance.
3.12 The pipe flow in Fig. P3.12 fills a cylindrical tank as shown. At time $t=0$, the water depth in the tank is 30 cm . Estimate the time required to fill the remainder of the tank.

Fig. P3.12
Solution: For a control volume enclosing the tank and the portion of the pipe below the tank,

$$
\begin{gathered}
\frac{d}{d t}\left[\int \rho d v\right]+\dot{m}_{\text {out }}-\dot{m}_{\text {in }}=0 \\
\rho \pi R^{2} \frac{d h}{d t}+(\rho A V)_{\text {out }}-(\rho A V)_{\text {in }}=0
\end{gathered}
$$

$$
\begin{gathered}
\frac{d h}{d t}=\frac{4}{998(\pi)\left(0.75^{2}\right)}\left[998\left(\frac{\pi}{4}\right)\left(0.12^{2}\right)(2.5-1.9)\right]=0.0153 \mathrm{~m} / \mathrm{s}, \\
\Delta t=0.7 / 0.0153=46 \mathbf{~ s} \text { Ans. }
\end{gathered}
$$
