## ENSC 388

## Assignment \#3

Assignment date: Wednesday Sept. 30, 2009
Due date: Wednesday Oct. 7, 2009

## Problem 1

A cylinder fitted with a piston contains
propane ( $T_{c r}=370 \mathrm{~K}, P_{c r}=4.26 \mathrm{MPa}, R=0.1885 \mathrm{~kJ} / \mathrm{kg} . \mathrm{K}$ ) gas at 100 kPa and 300 K , where the total volume of the system is 200 L . The gas is now slowly compressed according to the relation:

$$
P V^{1.1}=\text { constant }
$$

until the final temperature reaches 340 K .
(a) What is the final pressure?
(b)Elaborate on why the ideal gas assumption can be used?
(c) How much work is done during the process?

## Problem 2

Water contained in a piston-cylinder assembly undergoes two processes in series from an initial state where the pressure is 10 bar and the temperature is $400^{\circ} \mathrm{C}$.

Process 1-2: The water is cooled as it is compressed at constant pressure of 10 bars to the saturated vapour state.

Process 2-3: The water is cooled at constant volume to $150^{\circ} \mathrm{C}$.
(a) Sketch both processes on $T-v$ and $P-v$ diagrams.
(b)For the overall process determine the work, in $\mathrm{kJ} / \mathrm{kg}$.
(c) For the overall process determine the heat transfer.

## Problem 1:

Known:

$$
\begin{gathered}
\text { Critical properties of propane: } \\
T_{c r}=370 \mathrm{~K}, P_{c r}=4.26 \mathrm{MPa}, R=0.1885 \mathrm{~kJ} / \mathrm{kg} \cdot \mathrm{~K} \\
\text { Initial condition: } \\
P_{1}=100 \mathrm{kPa}, T_{1}=300 \mathrm{~K}, V_{1}=200 \mathrm{~L}
\end{gathered}
$$

Find:

- Final pressure of the process.
- The work is done during the process.

## Assumptions:

- Weight of the pistons is negligible.
- Equilibrium condition.
- Propane is ideal gas

## Analysis:

From ideal gas assumption:

$$
\begin{gathered}
\frac{P_{2} V_{2}}{T_{2}}=\frac{P_{1} V_{1}}{T_{1}} \\
\frac{P_{2} V_{2}}{340[\mathrm{~K}]}=\frac{100[\mathrm{kPa}] \times 0.2\left[\mathrm{~m}^{3}\right]}{300[\mathrm{~K}]} \rightarrow P_{2} V_{2}=22.667\left[\mathrm{kPa} . \mathrm{m}^{3}\right]
\end{gathered}
$$

Also, from compression process:

$$
P_{2} V_{2}^{1.1}=P_{1} V_{1}^{1.1}=100[\mathrm{kPa}] \times 0.2^{1.1}\left[\mathrm{~m}^{3.3}\right]=17.027\left[\mathrm{kPa} . \mathrm{m}^{3.3}\right]
$$

Thus:

$$
\begin{aligned}
\frac{P_{2} V_{2}^{1.1}}{P_{2} V_{2}}= & V_{2}^{0.1}=\frac{17.027\left[\mathrm{kPa} . \mathrm{m}^{3.3}\right]}{22.667\left[\mathrm{kPa} . \mathrm{m}^{3}\right]} \\
& \rightarrow V_{2}=0.0572\left[\mathrm{~m}^{3}\right]
\end{aligned}
$$

From ideal gas equation of state:

$$
P_{2}=\frac{m R T_{2}}{V_{2}}
$$

Applying ideal gas equation of state for state 1:

$$
m=\frac{P_{1} V_{1}}{R T_{1}}=\frac{100[\mathrm{kPa}] \times 0.2\left[\mathrm{~m}^{3}\right]}{0.1885\left[\frac{\mathrm{~kJ}}{\mathrm{~kg} \cdot \mathrm{~K}}\right] \times 300[\mathrm{~K}]}=0.345[\mathrm{~kg}]
$$

Thus:

$$
P_{2}=\frac{0.345[\mathrm{~kg}] \times 0.1885\left[\frac{\mathrm{~kJ}}{\mathrm{~kg} \cdot \mathrm{~K}}\right] \times 340[\mathrm{~K}]}{0.0572\left[\mathrm{~m}^{3}\right]}
$$

$$
\rightarrow P_{2}=396.6[\mathrm{kPa}]
$$

(b) Since pressures and temperatures are far from the critical state, the ideal gas equation of state can be used in this problem with no error.
(c) Work in a close system is calculated from:

$$
W=\int_{1}^{2} P d V
$$

$P$ can be related to $V$ with $P=C / V^{1.1}$ ( $C$ is constant):

$$
\begin{aligned}
W=\int_{1}^{2} \frac{C}{V^{1.1}} d V & \left.\left.=\frac{C}{1-1.1} V^{1-1.1}\right]_{1}^{2}=-\frac{C}{0.1} V^{-0.1}\right]_{1}^{2} \\
\rightarrow W & =-\frac{C}{0.1}\left(V_{2}^{-0.1}-V_{1}^{-0.1}\right)
\end{aligned}
$$

Substituting $C=P_{1} V_{1}^{1.1}=P_{2} V_{2}^{1.1}$ :

$$
W=-\frac{P_{2} V_{2}^{1.1} V_{2}^{-0.1}-P_{1} V_{1}^{1.1} V_{1}^{-0.1}}{0.1}=-\frac{P_{2} V_{2}-P_{1} V_{1}}{0.1}
$$

Thus:

$$
\begin{gathered}
W=-\frac{396.6[\mathrm{kPa}] \times 0.0572\left[\mathrm{~m}^{3}\right]-100[\mathrm{kPa}] \times 0.2\left[\mathrm{~m}^{3}\right]}{0.1} \\
\rightarrow W=-26.5[\mathrm{~kJ}]
\end{gathered}
$$

## Problem 2:

Known:
The two processes

$$
\text { Initial condition: } \quad P_{1}=10 \mathrm{bar}, T_{1}=400^{\circ} \mathrm{C}
$$

Find:

- Processes on $T-v$ and $P-v$ diagrams
- Overall work and heat transfer

## Assumptions:

- Weight of the pistons is negligible.
- Equilibrium condition.

## Analysis:

(a) Let us determine the three states of the process:

| State |  | $T\left[{ }^{\circ} \mathrm{C}\right]$ | $P[k P a]$ | $v\left[m^{3} / \mathrm{kg}\right]$ | $u[\mathrm{~kJ} / \mathrm{kg}]$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $?$ | 400 | 1000 | $v_{1}$ | $u_{1}$ |
| 2 | Saturated Vapour | $T_{2}$ | $P_{2}=P_{1}$ | $v_{2}$ | $u_{2}$ |
| 3 | $?$ | 150 | $P_{3}$ | $v_{3}=v_{2}$ | $u_{3}$ |

## State 1:

$$
P_{1}=10[\text { bar }]=1[\mathrm{Mpa}] \quad T_{1}=400\left[{ }^{\circ} \mathrm{C}\right]
$$

From Table A-5, $T_{\text {sat@1000 } k P a}=179.88{ }^{\circ} \mathrm{C}<T_{1}=400^{\circ} \mathrm{C}$. Thus state 1 is superheated vapour. Reading Table A-6 at $P_{1}=1 \mathrm{MPa}$ and $T_{1}=400^{\circ} \mathrm{C}$ :

$$
v_{1}=0.30661\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right] \quad u_{1}=2957.9\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right]
$$

| State |  | $T\left[{ }^{\circ} \mathrm{C}\right]$ | $P[k P a]$ | $v\left[\mathrm{~m}^{3} / \mathrm{kg}\right]$ | $u[\mathrm{~kJ} / \mathrm{kg}]$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Super heated vapour | 400 | 1000 | 0.30661 | 2957.9 |
| 2 | Saturated Vapour | $T_{2}$ | 1000 | $v_{2}$ | $u_{2}$ |
| 3 | $?$ | 150 | $P_{3}$ | $v_{3}=v_{2}$ | $u_{3}$ |

State 2:
Using Table A-5 for saturated vapour at $P_{2}=P_{1}=1 \mathrm{Mpa}$ :

$$
v_{2}=v_{g}=0.19436\left[\frac{m^{3}}{\mathrm{~kg}}\right] \quad u_{2}=u_{g}=2582.8\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right]
$$

| State |  | $T\left[{ }^{\circ} \mathrm{C}\right]$ | $P[k P a]$ | $v\left[\mathrm{~m}^{3} / \mathrm{kg}\right]$ | $u[\mathrm{~kJ} / \mathrm{kg}]$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Super heated vapour | 400 | 1000 | 0.30661 | 2957.9 |
| 2 | Saturated Vapour | 179.88 | 1000 | 0.19436 | 2582.8 |
| 3 | $?$ | 150 | $P_{3}$ | 0.19436 | $u_{3}$ |

## State 3:

Process 2-3 is constant volume, hence $v_{3}=v_{2}=0.19436 \mathrm{~kJ} / \mathrm{kg}$. Reading Table A-4:

$$
v_{f @ 150^{\circ} \mathrm{C}}=0.001091\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]<v_{3}=0.19436\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]<v_{g @ 150^{\circ} \mathrm{C}}=0.39248\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]
$$

As a result, state 3 is saturated mixture and:

$$
x_{3}=\frac{v_{3}-v_{f}}{v_{g}-v_{f}}=\frac{0.19436\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]-0.001091\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]}{0.39248\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]-0.001091\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]}=0.494
$$

$$
\begin{aligned}
u_{3}=u_{f @ 150^{\circ} \mathrm{C}}+x_{3} u_{f g @ 150^{\circ} \mathrm{C}} & =631.66\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right]+0.494 \times 1927.4\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right] \\
\rightarrow u_{3} & =1584.1\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right]
\end{aligned}
$$

| State |  | $T\left[{ }^{\circ} \mathrm{C}\right]$ | $P[k P a]$ | $v\left[\mathrm{~m}^{3} / \mathrm{kg}\right]$ | $u[\mathrm{~kJ} / \mathrm{kg}]$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Super heated vapour | 400 | 1000 | 0.30661 | 2957.9 |
| 2 | Saturated Vapour | 179.88 | 1000 | 0.19436 | 2582.8 |
| 3 | Saturated Mixture | 150 | 476.16 | 0.19436 | 1584.1 |

$T-v$ and $P-v$ diagrams are:

(b) The overall process work is:

$$
W=\int_{1}^{3} P d V=\int_{1}^{2} P d V+\int_{2}^{3} P d V
$$

Since process 1-2 is constant pressure and process 2-3 is constant volume ( $d V=0$ ):

$$
W=\int_{1}^{2} P d V=P\left(V_{2}-V_{1}\right)
$$

or per unit mass:

$$
\begin{gathered}
w=P\left(v_{2}-v_{1}\right)=1000[k P a] \times\left(0.19436\left[\frac{m^{3}}{\mathrm{~kg}}\right]-0.30661\left[\frac{\mathrm{~m}^{3}}{\mathrm{~kg}}\right]\right) \\
\rightarrow \rightarrow=-112.2\left[\frac{\mathrm{~kJ}}{\mathrm{~kg}}\right]
\end{gathered}
$$

(c) Applying the first law of thermodynamics:

$$
\begin{gathered}
q_{13}-w_{13}=\Delta u_{13} \rightarrow q_{13}=\Delta u_{13}+w_{13} \\
q_{13}=\left(1584.1\left[\frac{k J}{k g}\right]-2957.9\left[\frac{k J}{k g}\right]\right)+\left(-112.2\left[\frac{k J}{k g}\right]\right) \\
\rightarrow q=q_{13}=-1485.4\left[\frac{k J}{k g}\right]
\end{gathered}
$$

Note (1): Since the deviation of gas from ideal gas behaviour is greatest in the vicinity of the critical point, when pressure and temperature are far from this point, ideal gas assumption can be used without any essential error.

Note (2): At very low pressures gases behave as an ideal gas regardless of temperature

Note (3): At high temperatures, ideal gas behaviour can be assumed with good accuracy regardless of pressure (except for $P \gg P_{c r}$ ).
