14-76 The space between the two concentric cylinders is filled with water or air. The rate of heat transfer from the outer cylinder to the inner cylinder by natural convection is to be determined for both cases.
Assumptions 1 Steady operating conditions exist. 2 Air is an ideal gas with constant properties. 3 The air pressure in the enclosure is 1 atm .4 Heat transfer by radiation is negligible.
Properties The properties of water air at the average temperature of $\left(T_{\mathrm{i}}+T_{\mathrm{o}}\right) / 2=(54+106) / 2=80^{\circ} \mathrm{C}$ are (Table A-15)

$$
\begin{aligned}
k & =0.670 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C} \\
v & =3.653 \times 10^{-7} \mathrm{~m}^{2} / \mathrm{s} \\
\operatorname{Pr} & =2.22 \\
\beta & =0.653 \times 10^{-3} \mathrm{~K}^{-1}
\end{aligned}
$$

The properties of air at 1 atm and the average temperature of $\left(T_{\mathrm{i}}+T_{\mathrm{o}}\right) / 2=(54+106) / 2=80^{\circ} \mathrm{C}$ are (Table A-22)

$$
\begin{aligned}
k & =0.02953 \mathrm{~W} / \mathrm{m} \cdot{ }^{\circ} \mathrm{C} \\
v & =2.097 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s} \\
\operatorname{Pr} & =0.7154 \\
\beta & =\frac{1}{T_{f}}=\frac{1}{(80+273) \mathrm{K}}=0.002833 \mathrm{~K}^{-1}
\end{aligned}
$$

Analysis (a) The fluid is water:

$$
\begin{aligned}
& L_{c}=\frac{D_{o}-D_{i}}{2}=\frac{65-55}{2}=5 \mathrm{~cm} . \\
& R a=\frac{g \beta\left(T_{o}-T_{i}\right) L_{c}^{3}}{v^{2}} \operatorname{Pr}=\frac{\left(9.81 \mathrm{~m} / \mathrm{s}^{2}\right)\left(0.653 \times 10^{-3} \mathrm{~K}^{-1}\right)(106-54) \mathrm{K}(0.05 \mathrm{~m})^{3}}{\left(3.653 \times 10^{-7} \mathrm{~m}^{2} / \mathrm{s}\right)^{2}}(2.22)=6.927 \times 10^{8}
\end{aligned}
$$

The effective thermal conductivity is

$$
\begin{aligned}
F_{\mathrm{cyl}} & =\frac{\left[\ln \frac{D_{o}}{D_{i}}\right]^{4}}{L_{c}^{3}\left(D_{i}^{-3 / 5}+D_{o}^{-3 / 5}\right)^{5}}=\frac{\left[\ln \frac{0.65 \mathrm{~m}}{0.55 \mathrm{~m}}\right]^{4}}{(0.05 \mathrm{~m})^{3}\left[(0.55 \mathrm{~m})^{-7 / 5}+(0.65 \mathrm{~m})^{-7 / 5}\right]^{5}}=0.04136 \\
k_{\text {eff }} & =0.386 k\left(\frac{\operatorname{Pr}}{0.861+\operatorname{Pr}}\right)^{1 / 4}\left(F_{\mathrm{cyl}} \mathrm{Ra}\right)^{1 / 4} \\
& =0.386\left(0.670 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}\right)\left(\frac{2.22}{0.861+2.22}\right)^{1 / 4}\left[(0.04136)\left(6.927 \times 10^{8}\right)\right]^{1 / 4}=17.43 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}
\end{aligned}
$$

Then the rate of heat transfer between the cylinders becomes

$$
\dot{Q}=\frac{2 \pi k_{\mathrm{eff}}}{\ln \left(\frac{D_{o}}{D_{i}}\right)}\left(T_{0}-T_{i}\right)=\frac{2 \pi\left(17.43 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}\right)}{\ln \left(\frac{0.65 \mathrm{~m}}{0.55 \mathrm{~m}}\right)}(106-54)=34,090 \mathrm{~W}=\mathbf{3 4 . 1} \mathbf{k W}
$$

(b) The fluid is air:

$$
R a=\frac{g \beta\left(T_{o}-T_{i}\right) L_{c}^{3}}{v^{2}} \operatorname{Pr}=\frac{\left(9.81 \mathrm{~m} / \mathrm{s}^{2}\right)\left(0.002833 \mathrm{~K}^{-1}\right)(106-54) \mathrm{K}(0.05 \mathrm{~m})^{3}}{\left(2.097 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s}\right)^{2}}(0.7154)=2.939 \times 10^{5}
$$

The effective thermal conductivity is

$$
\begin{aligned}
F_{\mathrm{cyl}} & =\frac{\left[\ln \frac{D_{o}}{D_{i}}\right]^{4}}{L_{c}^{3}\left(D_{i}^{-3 / 5}+D_{o}^{-3 / 5}\right)^{5}}=\frac{\left[\ln \frac{0.65 \mathrm{~m}}{0.55 \mathrm{~m}}\right]^{4}}{(0.05 \mathrm{~m})^{3}\left[(0.55 \mathrm{~m})^{-7 / 5}+(0.65 \mathrm{~m})^{-7 / 5}\right]^{5}}=0.04136 \\
k_{\text {eff }} & =0.386 k\left(\frac{\operatorname{Pr}}{0.861+\operatorname{Pr}}\right)^{1 / 4}\left(F_{\mathrm{cyl}} \mathrm{Ra}\right)^{1 / 4} \\
& =0.386\left(0.02953 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}\right)\left(\frac{0.7154}{0.861+0.7154}\right)^{1 / 4}\left[(0.04136)\left(2.939 \times 10^{5}\right)\right]^{1 / 4}=0.09824 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}
\end{aligned}
$$

Then the rate of heat transfer between the cylinders becomes

$$
\dot{Q}=\frac{2 \pi k_{\mathrm{eff}}}{\ln \left(\frac{D_{o}}{D_{i}}\right)}\left(T_{o}-T_{i}\right)=\frac{2 \pi\left(0.09824 \mathrm{~W} / \mathrm{m} .{ }^{\circ} \mathrm{C}\right)}{\ln \left(\frac{0.65 \mathrm{~m}}{0.55 \mathrm{~m}}\right)}(106-54)=192 \mathrm{~W}
$$
