The effect of water drinking on orthostatic tolerance

Does a drink of water help prevent fainting?
We are conducting a research study to find the answer. We are looking for men and women aged 19-50 years to take part in a study examining the effect of water drinking on blood pressure control and fainting.

Your participation will help improve the treatment and management of fainting spells.

As a thank you for your participation, you will receive $75 in compensation.

Your participation in this study will involve three tests, on three separate days, of your blood pressure control and susceptibility to fainting. On each day you will be asked to drink a glass of water. The temperature of the water will change on the different test days.
