To meet the statistics pre-requisite for the Masters of Public Health, students must complete a graduate or undergraduate statistics course. Courses that are accepted generally meet the following criteria:

- A course with the word "statistics" in the course title, or;
- A course that has at least three of these five topics:
  1. Descriptive statistics (means, proportion and standard deviation) and graphical methods (histogram and bar chart)
  2. Estimation and 95% confidence intervals
  3. Hypothesis testing and p-values
  4. Correlation
  5. Linear regression

We also recommend that you look into online offerings of introductory statistics courses, as these courses are often self-paced and can offer flexibility on the start date of course. However, note that you need to successfully complete the course prior to the start of the program. We don’t recommend these specifically, but some courses to consider are:

- Thompson Rivers University: STAT 1201 (Introduction to Probability and Statistics
- Athabasca University: MATH 215 (Introduction to Statistics)

Applicants who meet the statistics prerequisite, but wish to complete a refresher may be interested in the Introduction to Statistics online module offered by UDACITY. Note that this module does not fulfill the prerequisite requirement - it is a suggested refresher only.

- The UDACITY course, **Introduction to Statistics**:
