Applications are invited for a 18-month postdoctoral position starting in February 2018, in the climate research group of the CNRM in Toulouse (France) to work on the following subject: "Development and application of process-based and teleconnection diagnostics to assess the ability of climate models to simulate the mid-latitude atmospheric dynamics and teleconnections". The deadline for application is **October 31st 2017**.

**Framework:**

The weather and climate of the Arctic have been changing rapidly in recent years and these profound transformations are projected to continue in the decades to come. Such changes may have significant impacts on northern mid-latitudes through both atmospheric and oceanic linkages (e.g., Overland et al. 2016, Douville 2009, Douville et al. 2017). Yet, global climate models still show serious deficiencies in the simulation of the mid-latitude atmospheric dynamics and/or teleconnections at various timescales. Developing related metrics (e.g., Cattiaux et al. 2016) and assessing the current-generation climate models might therefore be helpful for understanding the spread of the northern mid-latitude response in global climate projections (e.g., Cattiaux et al. 2013, Cattiaux and Cassou 2013, Peings et al. 2017).

The proposed postdoctoral fellowship is funded by the European Union through the Horizon 2020 APPLICATE project (https://applicate.eu/). The main objective is to contribute to the 1st workpackage focusing on the development of advanced diagnostics to be used to constrain weather and climate models. The task is here exclusively on climate models and encompasses both the development and (mostly) the application of such metrics to evaluate CMIP5 and CMIP6 models and, possibly, constrain their global climate projections.

**Work description:**

The proposed work will mainly consist in the following tasks:

1) Select and prepare the monthly and daily observations/reanalyses and model outputs necessary for the study;
2) Develop and (mainly) apply process-oriented diagnostics for characterizing the northern mid-latitude atmospheric dynamics (e.g., location, intensity and sinuosity of the jets, storm track activity, blockings, ...);
3) Develop and (mainly) apply teleconnection diagnostics (lead-lag correlations or composites, possibly Maximum Covariance Analysis) focusing mainly on Arctic-midlatitude linkages;
4) Evaluate both CMIP5 and CMIP6 models using those metrics;
5) Look for possible emergent constraints, i.e., statistical relationships between model performances (metrics) and model responses (to climate change);
6) Write project reports and scientific articles, and give presentations in APPLICATE meetings and international conferences.
Required qualifications:

1) A Ph.D. in atmospheric sciences or an engineer diploma obtained before the date of the application.
2) Experience with mid-latitude atmospheric dynamics and teleconnections.
3) Strong programming skills in post-processing and visualization software (e.g., CDO, NCL, R), as well as experience in handling large data sets.
4) Strong communication and organizational skills and an ability to effectively communicate results of scientific research in APPLICATE meetings and international workshops.

Moreover, an experience in using climate diagnostic packages such as ESMValTool (https://www.esmvaltool.org/) will be welcome.

Practical information:

The successful applicant will be contracted by Météo-France and will be based at the “Centre National de Recherches Météorologiques” (Toulouse, France; http://www.cnrm.meteo.fr/) within the climate research group. The opened position will start as soon as possible, possibly as early as February 2018 for a 18-month duration. The net salary is commensurate with qualifications and experience, ranging from 2800€ to 3300€, after most of the taxes and health insurance premiums have been deducted.

For full consideration, an application letter including a detailed statement of research interest, along with a curriculum vitae (including research experience, publications and conferences, programming skills and different language practises) and the names, telephone and email address of 2 referees should be sent by email before October 31st 2017 to:
herve.douville@meteo.fr
and
julien.cattiaux@meteo.fr
