

IAT 355 Visualization

Interaction

Lyn Bartram

FingerGlass, vis.berkeley.edu

All techniques fail at some point

SFU

When is static not enough?

- Scale
 - Too much data
 - Too many dimensions
 - Story telling
 - Guided tour
 - Exploration
 - Flexible paths and combinations of views
 - Learning
 - We learn better when we actively manipulate and engage alternatives
-

What to do with too much data?

pack all the data in one
complex representation

use interaction to reveal
different subsets of the data

Partition the data into
multiple views

<http://bl.ocks.org/jasondavies/raw/1341281/>

IAT 355 | Interaction

Keim, Daniel A., and Hans-Peter Kriegel. "VisDB: Database exploration using multidimensional visualization." *Computer Graphics and Applications*, IEEE 14.5 (1994): 40-49.

Even a simple interaction can be quite powerful

Dancing histogram demo

<http://bi.ocks.org/marcdhansen/1ace92ea6344aa05bbac>

IAT 355 | Interaction

A stacked histogram allows three judgements: (i) the trends on the total height of the columns, (ii) the proportion of each category within each column and (iii) the trends in the lowest category. The trends, or even inter-column comparisons for any other category is very difficult as the blocks are at different heights.

The interactive stacked histogram solves this problem by allowing different trends to be analysed using the same dynamic graph. It is an example of a general principle of adding interactivity to existing paper visualisations.

Interaction

J. Heer and B. Shneiderman. Interactive Dynamics for Visual Analysis. ACM Queue, 2012.

Specify view

- Encode (visualize)
- Arrange
- Extract
- Derive New

Manipulate view

- Select items to highlight, query
- Explore data for patterns at different levels
- Coordinate and organize views
- Emphasize

Interaction Techniques

- Filter
- Layout
- Sort
- Brushing and linking
- Arrange data
- Navigate
- Annotate
- Calculate new values
- Reconfigure
- Dynamic queries

IAT 355 | Interaction

essential interactive operations for supporting exploration

Selection

Direct (basic pointing)

- Point, area, lasso
- “nearby” (bubble cursor)
- Click, touch, hold, hover

Partial or gradual selection

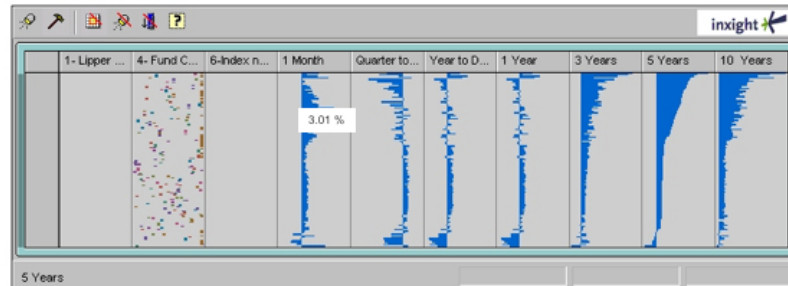

- Pop up tooltips
- Hovering brings up details of item

IAT 355 | Interaction

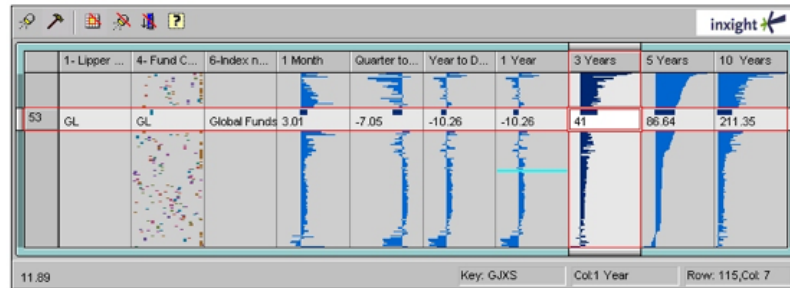

Gradual selection

- Hovering mouse cursor brings up details of item

Gradual selection

- More details are displayed upon selection

IAT 355 | Interaction

So the thing to note here is that while there is a simple selection the resulting operation may not be trivial

Annotation

- Capture mechanism for documenting process and insights
- Adds new data

[Annotation Graphs: A Graph-Based Visualization for Meta-Analysis of Data based on User-Author Annotations](#)

[N. Diakopoulos, Storytelling with Data: Context is King.](#)

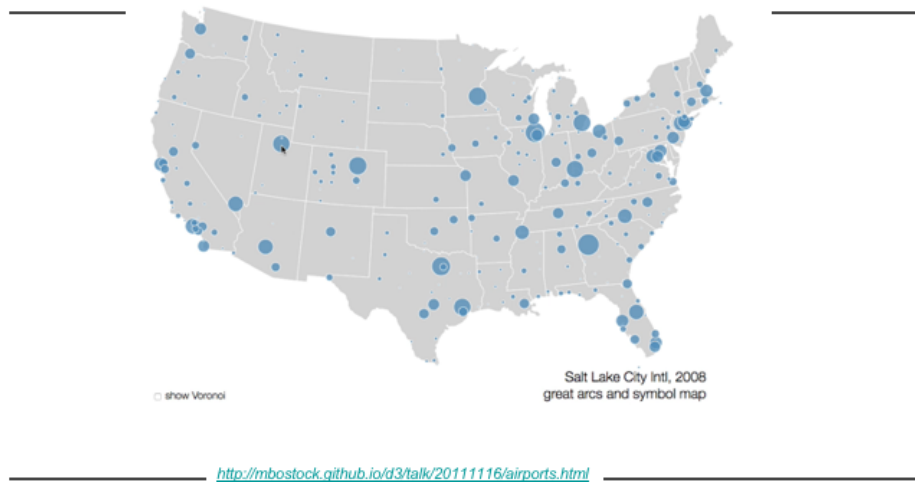

Heer, J., Viégas, F. and Wattenberg, M. "Voyagers and voyeurs: supporting asynchronous collaborative information visualization." Proceedings of ACM CHI 2007. ACM.

IAT 355 | Interaction

Selection can be specific or broad

Pointing, “tooltips” and annotation

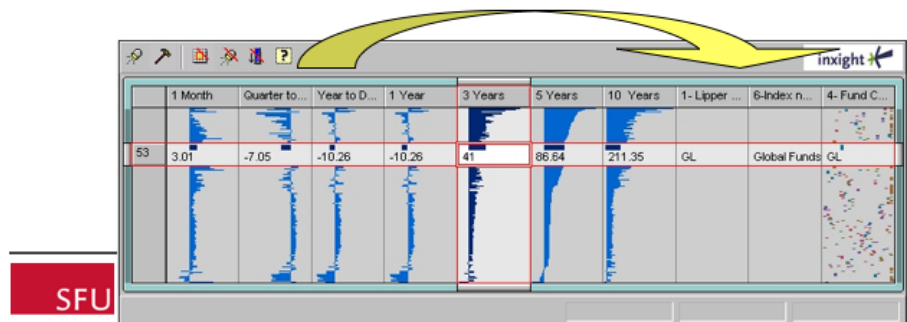

IAT 355 | Interaction

Show with Voronoi, not just about selecting but about extracting

Reconfigure: Rearrange View

- Keep same fundamental representation and what data is being shown, but rearrange elements
 - Alter positioning
 - Affects alignment

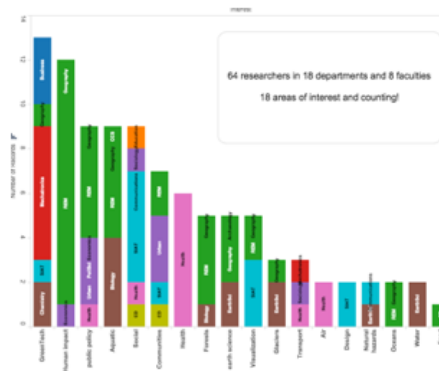

Sorting

Sorting

Can sort data with respect to a particular attribute in Table Lens

Slide adapted from John Steele

<https://public.tableau.com/profile/vn.barttram#/?vizhome/SFUClimateResearchFinal/Bars>

IAT 355 | Interaction

When should we not sort

Dynamic sorting

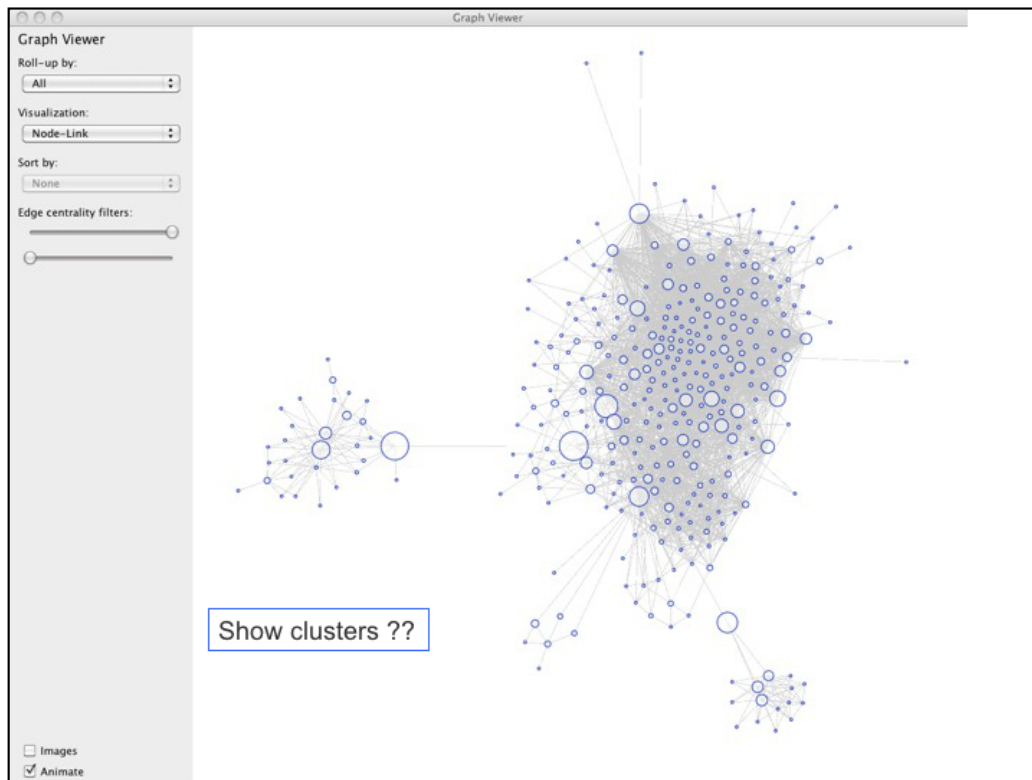

- Interactive example

http://www.clearlyandsimply.com/clearly_and_simply/2011/11/dynamic-sorting-with-tableau.html

SFU

IAT 355 | Interaction

Sorting to reveal structure (seriation)

J. Heer and B. Shneiderman. Interactive Dynamics for Visual Analysis. ACM Queue, 2012..

IAT 355 | Interaction

Reconfigure: Change arrangement

- Show a different arrangement in same form

Slingsby, Dykes, and Wood. Configuring Hierarchical Layouts to Address Research Questions. IEEE TVCG 15(6), Nov-Dec 2009 (Proc. InfoVis 2009)

London Property example

Hierarchy

- House type – neighbourhood - sale time
- Colour → price variance
- Size → sales
- between neighborhoods: different house distributions
- within neighborhoods: see similar prices

Slingsby, Dykes, and Wood. Configuring Hierarchical Layouts to Address Research Questions. IEEE TVCG 15(6), Nov-Dec 2009 (Proc. InfoVis 2009)

London Property example

Hierarchy

- Neighborhood - house type - sale year - sale month.
- .Colour → avg price
- Size → fixed
- expensive neighborhoods near center

Slingsby, Dykes, and Wood. Configuring Hierarchical Layouts to Address Research Questions. IEEE TVCG 15(6), Nov-Dec 2009 (Proc. InfoVis 2009)

Encoding: change visual variables

- Marks

IAT 355 | Interaction

Encoding: change presentation (form)

- Remember this?

IAT 355 | Interaction

Encoding: change presentation

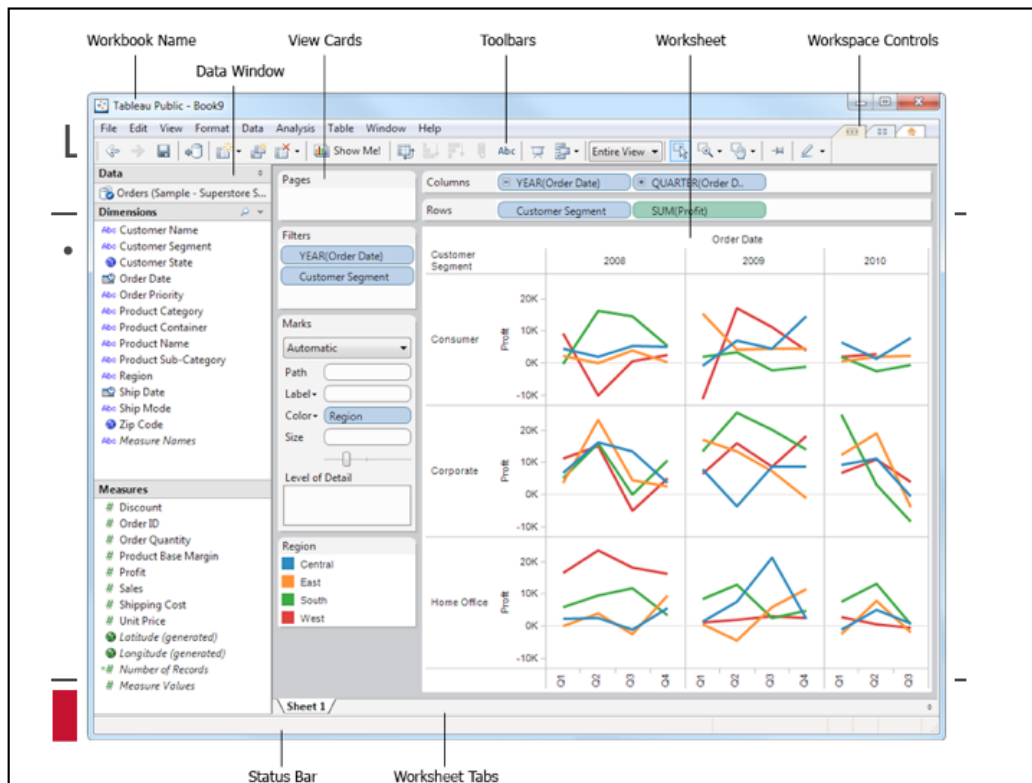

- Transitions are important

<http://bl.ocks.org/mbostock/3943967>

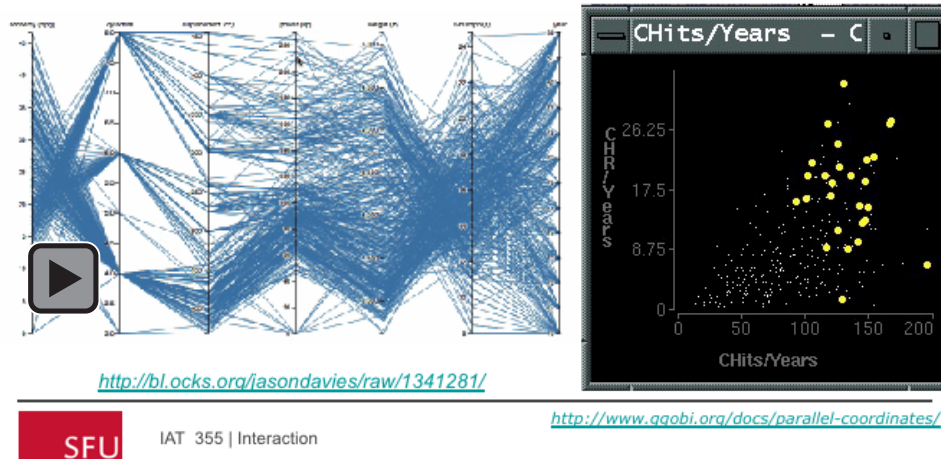

IAT 355 | Interaction

Highlighting/ “Brushing”

- Direct attention to a data subset within a graph [Wills 95]

Brushing can be applied by to highlight selection by:

Direct interaction

Area interaction

Value interaction : data items that match some threshold.

Play the video on the left to see an example of direct selection brushing.

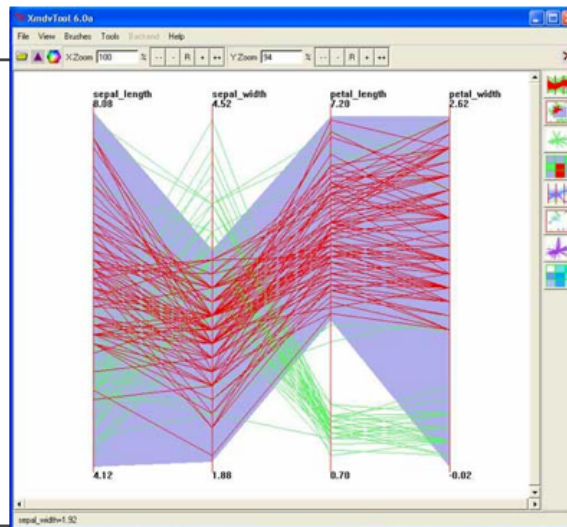

At the very end you will notice a particular variant of brushing called “scrubbing”, where the area brush is rapidly moved around the data items.

Area brush, Annotation

http://www.snapgene.com/products/snapgene_viewer/

- Value brush
- Brushes can be combined

SFU

IAT 355 | Interaction

With a value brush, some combination of attribute queries – data items that fit some threshold in the attribute specified – can be highlighted. These brushes can be composited (overlaid), typically using colour, and subject to the same challenges that using colour generally presents.

Interaction for exploration

- Overcome limitations of display and memory capacity
 - Navigation
- Get more info about a case
 - zooming
 - Detail on demand
- Move aggregation view to individual view
 - Filter, reconfigure

https://www.ted.com/talks/gary_flake_is_pivot_a_turning_point_for_web_exploration#t-24588

IAT 355 | Interaction

Interaction is critical not only to moving around your data space but more fundamentally to exploration for discovery. We saw in this TED talk by Gary Flake how interaction fluidity is key to exploration and discovery.

Navigation

- Panning
 - Smooth movement of camera across scene (or scene moves and camera stays still)
- Scroll
 - (some subset of) view is moved horizontally or vertically
 - Bounded
- Zoom
 - View enlarges/shrinks around central point
 - Pixels/detail gets larger/smaller

Zooming

Intelligent Zooming

- Show semantically relevant information out of proportion
- Smart speed up and slow down
 - <https://www.coursera.org/learn/interactive-computer-graphics/lecture/dDfD/1-1-scrolling-interface>

Semantic Zooming

- Zooming can be conceptual as opposed to simply reducing pixels

<http://www.cvas.tuwien.ac.at/projects/semtimezoom>

IAT 355 | Interaction

Geometric (standard) zooming:

The view depends on the “physical” /representational properties of what is being viewed

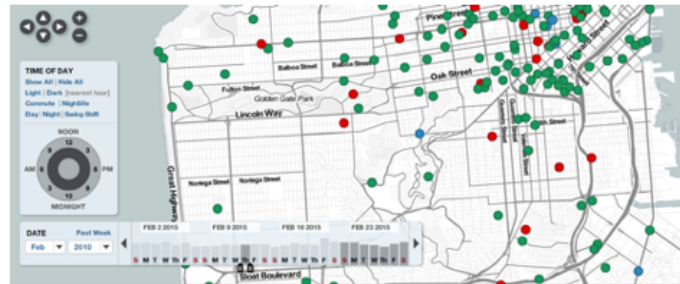

Semantic Zooming:

When zooming away, instead of seeing a scaled-down version of an object, see a different representation

The representation shown depends on the meaning to be imparted.

Filtering

- Extract data
- Selection
- Query

IAT 355 | Interaction

[brushing] Highlight data of interest (and associate them across multiple views)

[filtering] remove or reduce the visual representation of unnecessary or spurious data

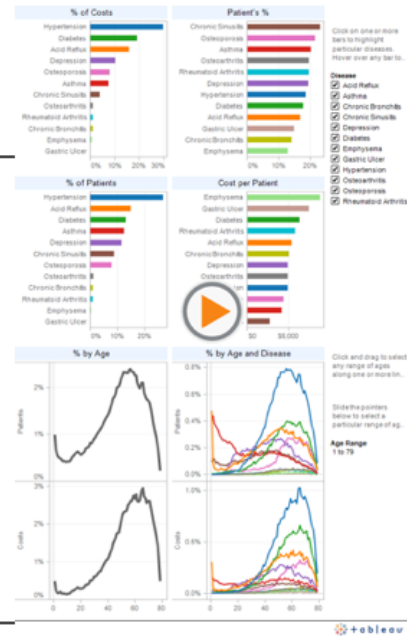

Not a binary operation, but a gradient of responses

Extract data of interest

Data can be selected by brushing values or specifying *queries*

Filter/Extract

- Change the set of data cases being presented
 - Focusing
 - Narrowing/widening
- Simple filtering just removes all data not part of the selection.

SFU

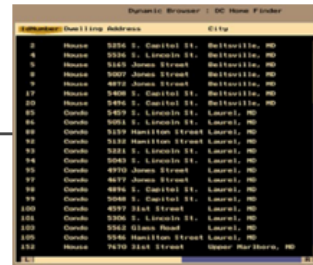

IAT 355 | Interaction

Queries and filtering

A data query looks like:

```
SELECT house from seattle_homes  
WHERE price < 1000000 AND bedrooms > 2  
ORDER BY price
```

```
SELECT name from cereals WHERE sugars  
< 4 and type = Health
```

ID	House	Price	Location	City
1	House	5354	S. Capitol St.	Seattle, WA
2	House	5354	S. Lincoln St.	Seattle, WA
3	House	5145	James Street	Seattle, WA
4	House	5007	James Street	Seattle, WA

IAT 355 | Interaction

Only shows exact matches !! Removes context ..

Don't know magnitude of results

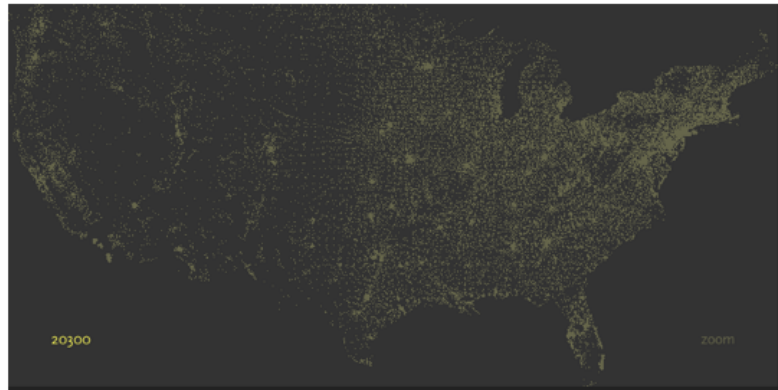

Too few or too many hits!

No helpful context is shown

No hint on how to reformulate the new query, and lose incremental results as you do

Reformulating to a new query can be slow

ZipDecode

<http://benfry.com/zipdecode/>

IAT 355 | Interaction

Overview + Detail

- Providing an overview of the data set can be extremely valuable
 - Helps present overall patterns
 - Assists user with navigation and search
 - Orients activities
- Generally start with overview
- Users need to examine details, individual cases and variables
- How to allow them to find and focus on details of interest?
- provide details without losing overview (CONTEXT)

IAT 355 | Interaction

Allow viewer to examine cases and/or variables in detail while still maintaining context of those details in the larger whole

Concession

You simply can't show everything at once

Arrangement depends on what kinds of tasks and context you need to support

Overview + Detail

displays can be combined via either time or space

- Time - Alternate between overview and details sequentially in same place
 - Navigation (time)
- Space - Use different portions of screen to show overview and details (View transformations)
 - Lenses
 - Details on demand

Location probes

IAT 355 | Interaction

Single View

- Main + mini-map
- *Overview* or *Detail* gets the most space
 - Panning in one affects the other
- Could be extended to 3 or more levels
- Issue: How big are different views and where do they go?

Magic lens

Magic lenses are probes that give details of a region, revealing additional properties

IAT 355 | Interaction

Interaction for discovery and analysis

The *Shneiderman mantra*

- Overview first, zoom and filter, details on demand
- Makes use of both space and time

IAT 355 | Interaction

Limits contextual view of more information

May just be more info about a case

May be moving from aggregation view to individual view

May not be showing all the data due to scale problem

May be showing some abstraction of groups of elements

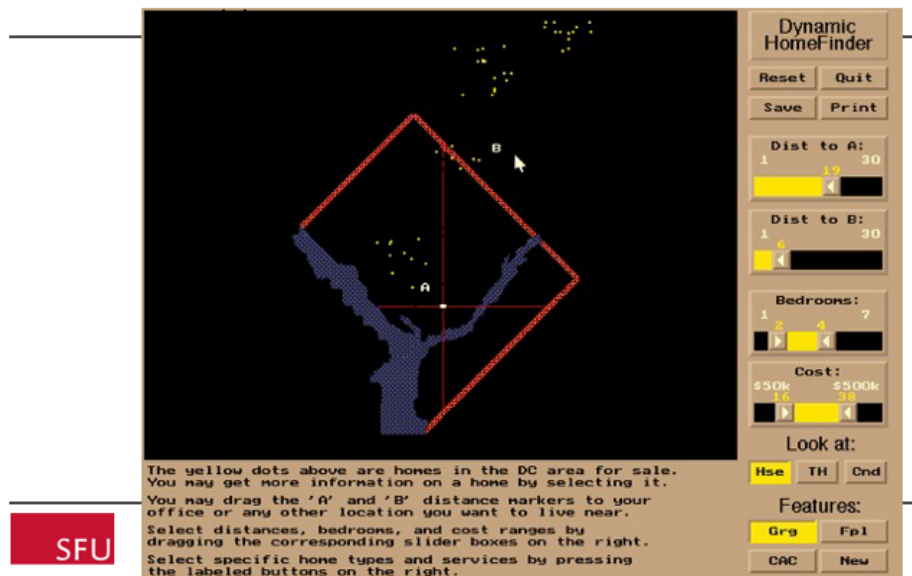

Expand set of data to show more details, perhaps individual cases

The Plane Truth

<http://www.informationisbeautiful.net/visualizations/plane-truth-every-single-commercial-plane-crash-visualized/>

Dynamic Queries [Williamson and Shneiderman 92]

Specifying a query brings immediate display of results

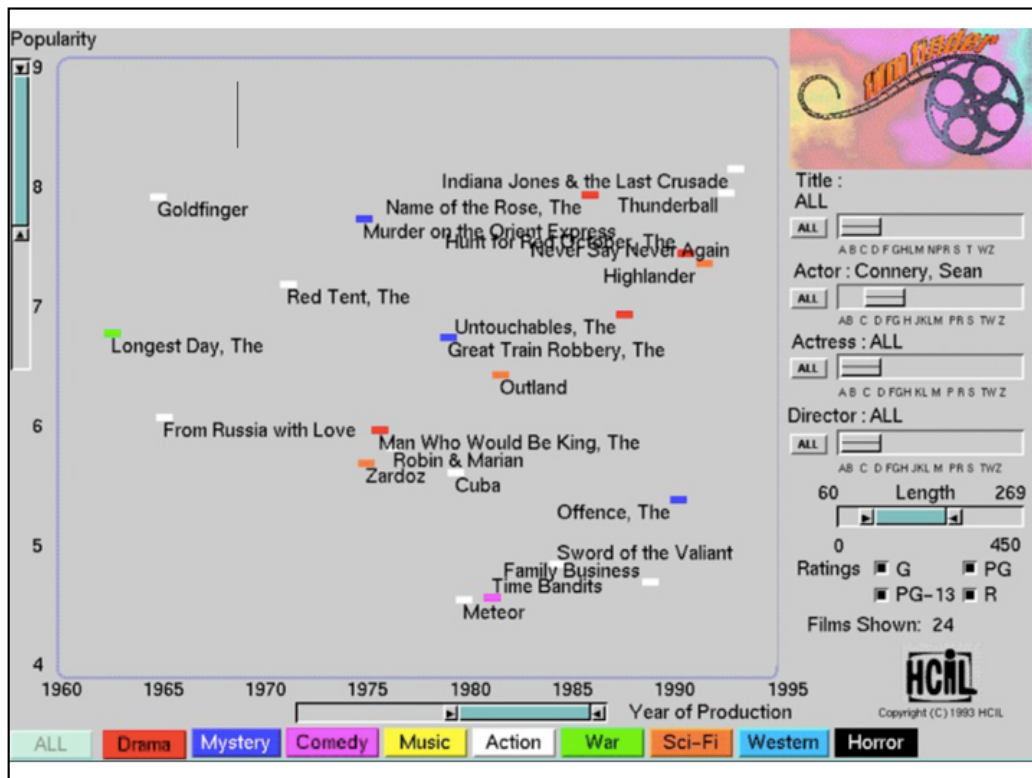

Responsive interaction (< .1 sec) with data, concurrent presentation of solution

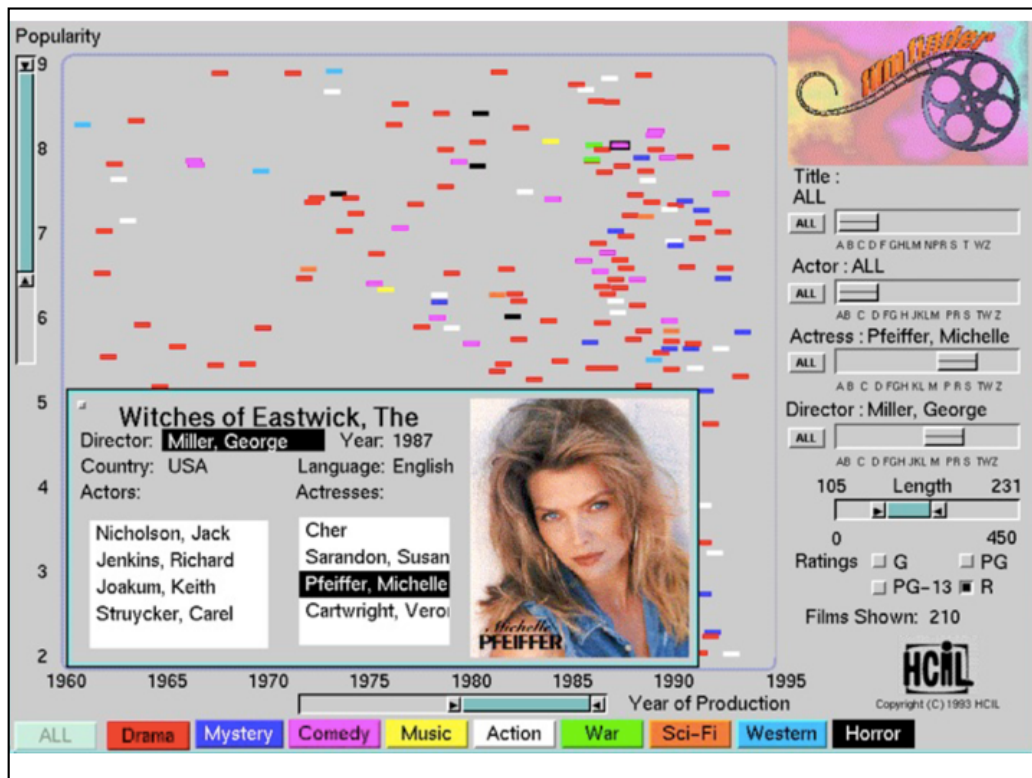

“Fly through the data”, promote exploration, make it a much more “live” experience

Iterative, incremental and flexible query-response loop

Refinement is easy and manipulable

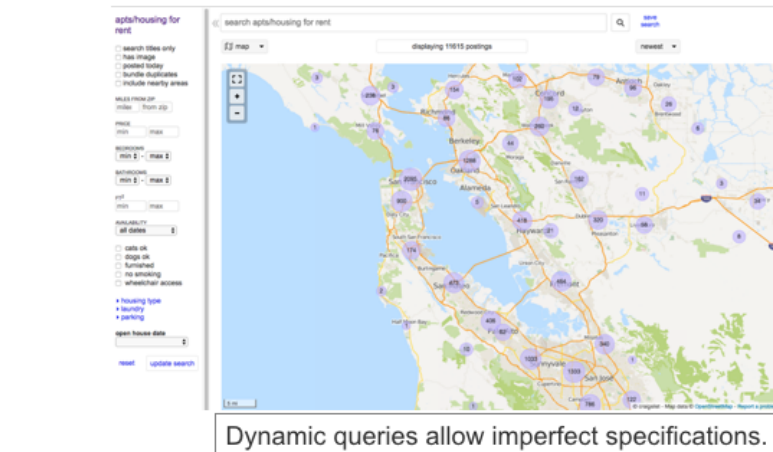

DETAILS ON DEMAND

A more familiar example

IAT 355 | Interaction

Imperfection is the Idea at the heart of the Dynamic Query technique.

There often simply isn't one perfect response to a query

Want to understand a set of tradeoffs and choose some "best" compromise

You may learn more about your problem as you explore

Dynamic Queries Revisited

SFU

IAT 355 | Interaction

HomeFinder (Williamson and Shneiderman, 1992)

Sensitivity [Spence]

SFU

IAT 355 | Interaction

HomeFinder (Williamson and Shneiderman, 1992)

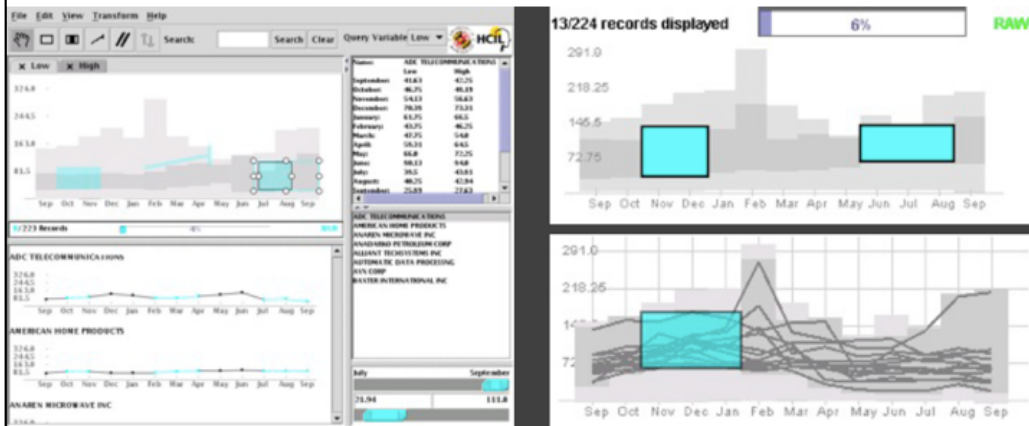

Black encoding of houses that fail one attribute limit provides *sensitivity* information

Data in controls

IAT 355 | Interaction

TimeSearcher [Hochheiser and Shneiderman 02]

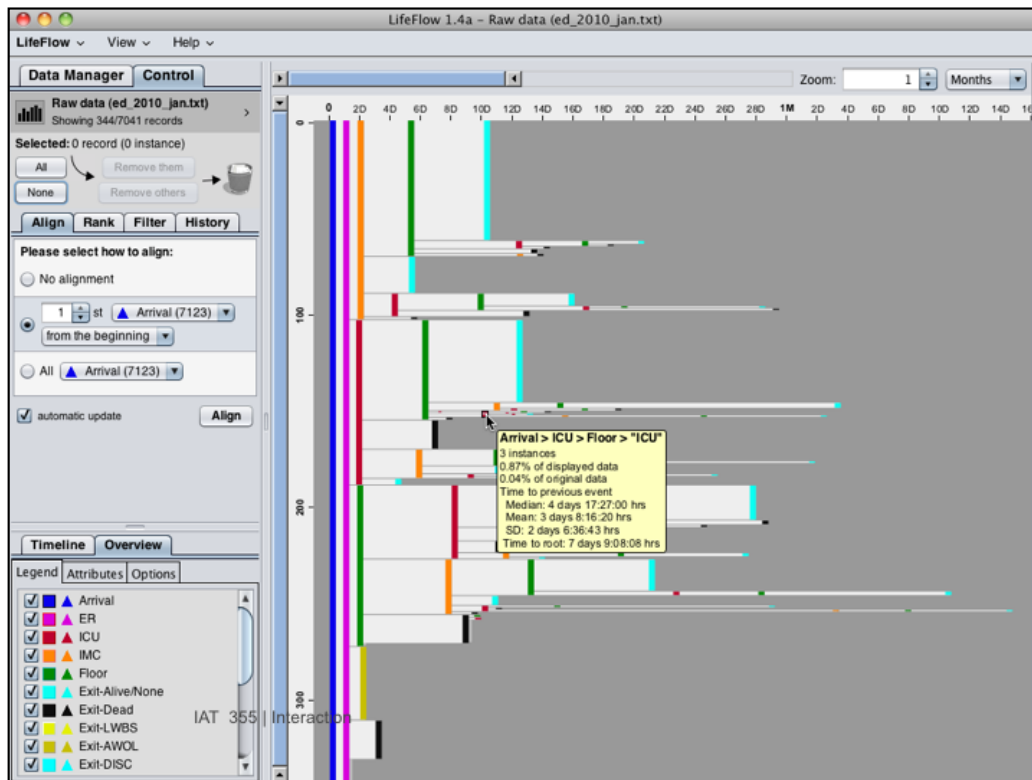

IAT 355 | Interaction

Visual representation of world of action including both the objects and actions

Rapid, incremental and reversible actions

Selection by pointing (not typing)

Immediate and continuous display of results

After removing all the common cases, we have 344 patients left.

These are mostly the patients who were admitted.

There are many information that I can explain from this visualization here, but I will go straight into the case that our physician partners are mostly interested in.

The mouse is pointing at this sequence, which represents the “bounce backs” patients, meaning patients who were transferred from ICU to Floor because they seemed to get better, however, they were transferred back to the ICU.

So the physician are interested in finding these patients to analyze what made them made the wrong decisions.

*optional

Another case is the step ups, which means the patients whose level of care were escalated to higher level, you can see from the visualization that there were patients who were transferred from ER to Floor (green) to ICU (red) and IMC (orange).

The number of these patients and the average transferred time could be compare to the hospital standards to measure the quality of care.

Interaction is not simple

- Composite tasks and questions
- Intent of task is critical
 - Search ?
 - Explore?
 - Analyse?
 - Investigate and compare?
 - Quick glimpse for overall synthesis?
 - ...
- Extra interaction may be required
- Exploratory
 - Circuit designer investigating how design parameters contribute to performance aspects
- Seeking
 - Navigation through a space, categorically-driven filtering
- Opportunistic
 - "what's there?" defining space of opportunities
- Involuntary/ambient
 - Information appears and may trigger response

Summary

- Most visualizations are interactive
- Good visualizations are task dependent
 - Pick the right interaction techniques

Fundamental interaction tasks

- Encode (visualize), Arrange, Extract, Derive New, highlight, query explore, Coordinate and organize views

Techniques

- Extract, sort, annotate, layout, choose view, dynamic queries, brushing, filter, sensitivity
